There is a growing acknowledgment that across society and industry, the complexities and uncertainties of today's global challenges cannot be adequately addressed through isolated disciplinary approaches. As accreditation bodies require the addition of more contextual skills-based development into curricula, an increase in team projects, among other things, is a key way to address this. The development of these interdisciplinary and transdisciplinary competencies and skills is challenging since it is affective and connected to the state of "being" of the student. The complexities escalate when classes are scaled up and there is no pedagogical development for lecturers to facilitate these teaching engagements. The skill set required to lead interdisciplinary team project teaching is very different to that of traditional lecture or seminar-based teaching. As part of a broader project on evaluating frameworks and structures for delivering interdisciplinary teamwork at extremely large scale and understanding this modern teaching role, here we will focus on the comparison of the professional journeys of two leading practitioners of large-scale interdisciplinary team project modules. In reflecting on the similarities and differences of our contexts (global north and global south) and approaches, we

[1]*L. Smith* — *F. R. Truscott*
lelanie.smith@up.ac.za — *f.truscott@ucl.ac.uk*

identify the future direction and needs of this specialist area. This paper aims to start a sector-wide discussion of the requirements of this contemporary teaching role, and starts to outline how to better prepare and support those undertaking these roles.

1 INTRODUCTION

Today's problems are multifaceted and interconnected, spanning social, environmental, economic, and other domains simultaneously, requiring different skills for the future workplace (World Economic Forum, 2023). This requires a pedagogical shift towards interdisciplinary education (Van den Beemt et al., 2020) that prepares students for the complexities of real-world challenges by cultivating ways of thinking, being, and practising that transcend traditional disciplinary boundaries (Strachan et al., 2019).

By fostering a learning environment that promotes interdisciplinary thinking and action, universities can nurture graduates who are not only socially aware, empathetic, and emotionally intelligent but also deeply connected, cooperative, and ethically responsible (Strachan et al., 2019; Kamp, 2018). Often these are addressed via active learning methods, such as project-based learning (PjBL) (Feldman, 2006; Gavin, 2011), and in particular the introduction of interdisciplinary team projects (Kolb, 2015, Graham, 2018).

Engineering programs often have large class sizes (300+) due to the subject's popularity and government initiatives aimed at increasing STEM graduates. Teaching such large cohorts using a PjBL framework can be ineffective without proper curriculum oversight and adequate scaffolding of PjBL skills for students (Edström and Kolmos, 2014). Directly scaling methods designed for small classes is not viable due to resource constraints. Consequently, coordinators of large-scale team projects have had to develop or adapt approaches to create and deliver these teaching events (Truscott et al., 2021; Smith and Trent, 2020; 2021).

Alongside the lack of large-scale active learning methods, much of the literature is focused on student experience rather than staff experience in this context (Truscott et al, 2023). This makes it hard for staff who would like to move into teaching interdisciplinary teamwork with their large cohort, to know what to expect or how to get started, particularly as there may be very few people within their institution working effectively in this area.

In this paper, we will start addressing these two gaps in the literature, by comparing the career journey and experience of two well-established and internationally recognized practitioners of extremely large-scale (900+) interdisciplinary teamwork. As a first step we unpack the requirements of this role, identifying the skill set needed and how to better support those undertaking this role.

2 METHODOLOGY

2.1 Context

The two practitioners are situated in leading institutions in the global north and the global south. Both practitioners use active learning, cross departmental teaching frameworks.

The Joint Community Project (JCP) is compulsory for all 1650 second-year students across 18 different programmes in the Faculty of Engineering, Built Environment and IT at University of Pretoria, South Africa. The module aims to develop social awareness, teamwork competency and civic responsibility. Service learning is used as an active pedagogical approach to provide the students with the opportunity for hands-on skills-development within a community context. Each student has 40 hours that is used towards preparation for their 40 hours of field work in the community. Ideally in preparation for their community engagement, students should be observed during their team interactions, as well as their interactions with the community partners (who range from professionals working in NGOs to community leaders in townships) and supported through feedback and an opportunity to repeat the engagement. The scale of the cohort, which breaks down to 350 interdisciplinary teams of 5 students and more than 60 community partners requires carefully designed strategies to ensure authentic development of the students. The two unique strategies are: 1) a vertically integrated mentorship/coaching team of senior students framed as a “company”; 2) a series of scenario based experiential learning engagements.

Engineering Challenges is a very large and complex core module for between 900 and 1000 students from across seven departments within the Engineering Faculty at UCL, UK. It is an interdisciplinary team-based project module taken by a majority of the first-year students within the faculty in term 1 and is central to UCL’s teaching framework. As the first team project experience for our undergraduate students, it aims to introduce them to how projects work and the skills needed to collaborate with others; the module focuses on what engineers do rather than what they know. While the structure and assessment pattern are common throughout the module, the content is tailored for each department to address problems and approaches relevant to that discipline. The module is delivered by a teaching team composed of 15-20 Departmental Leads assigned by departments, 40-50 Postgraduate Teaching Assistants (PGTAs) and a Module Lead working at faculty level. Engineering Challenges is split into two parts, a three week department based individual project and an interdisciplinary seven week team project. For the seven week team project, departments are paired up and work on aspects of an umbrella project, building a TB vaccine production plant in Uganda. Subsequently, the module is more like multiple modules running in parallel, each with different academic staff and content but all set within a common structure. The module is highly structured with a range of support mechanisms for both staff and students, including behaviour modelling, co-teaching and support workshops.

2.2 Approach

Two experienced, extremely large scale, interdisciplinary learning facilitators, located in research-intensive institutions in the global north and global south explored their role, development and challenges using autoethnographic writing (Ellis and Bochner, 1999; Choi, 2012) and a shared narrative inquiry (Chase, 2005). The two facilitators met monthly for the last 6 months to discuss challenges and experiences in facilitating interdisciplinary classes of 900+ students. The intention was simultaneously to share practice as well as challenges in the process of coordinating such a module. Based on these engagements and using questions drawing from a life course approach and reflective practice perspective (Du and Lundberg, 2021) the authors discussed 9 questions that could meaningfully capture their experience.

After these 9 questions had been agreed upon both researchers reflected and answered these questions and then read each other's reflections to further adapt their own. As a final step, both authors spend time discussing each of the question responses and reflecting on similarities and differences that could be identified. Based on these discussions, different themes were identified and shared as a means to unpack the requirements of this role, identifying the skill set needed and how to better support those undertaking this role.

3 RESULTS

In this section we share our findings after our reflections and discussions of the 9 questions.

1. *What motivated your focus/interest on teaching in the context of facilitating large interdisciplinary engineering classes?*

Smith and Truscott, possess a keen interest in personal development and transformation. Smith, trained as a yoga teacher and proficient in various coaching modalities alongside her PhD in Aerospace Engineering, while Truscott transitioned from Organic Chemistry to Chemical Biology and Biochemical Engineering before delving into Engineering Education, with extensive experience in outreach and community engagement.

Smith's teaching experience began with overseeing a 900-student interdisciplinary design module, focusing initially on logistical effectiveness and later emphasising authentic student development through peer support and reflective assessment. Truscott, on the other hand, started with smaller workshops and community engagement activities within an interdisciplinary research context. Her focus shifted towards facilitating communication across disciplinary boundaries, culminating in her work within large-scale educational contexts.

Both facilitators share a common interest in fostering overlooked professional competencies in engineering curricula. They draw from diverse backgrounds to identify specific abilities, guiding students towards expert-level proficiency through reflective engagements. Their diverse professional backgrounds drive their embrace of interdisciplinary teaching approaches, fuelled by curiosity about developing complex skills, particularly in large-scale educational settings.

2. *How did this focus become a significant aspect of your career, and what factors influenced its importance?*

Despite their differing backgrounds, Smith and Truscott share a common focus on facilitating and coordinating large-scale initiatives. They attribute their success to comfort with uncertainty, open curiosity, a willingness to explore new ideas, and a preference for learning through action rather than waiting for perfection—an unattainable goal at scale.

Both value self-reflection and recognize that personal transformation occurs through exposure to diverse disciplines, environments, and interactions, rather than merely through content. They are deeply invested in creating and curating such transformative experiences for their students, albeit challenging at scale. They emphasise the importance of maintaining relational connections, mentorship, and small group engagement, while managing resource constraints.

Smith focuses on streamlining logistical aspects and preserving the personal journey and connections for students within interdisciplinary large-scale modules, whereas Truscott emphasises ensuring the relevance and relatability of such modules to students.

3. *Reflecting on your own development/practice, what specific actions did you take to support your ability to run interdisciplinary large scale modules?*

Both facilitators inherited an existing module and then evolved it based on their teaching philosophy, experience and external circumstances. They both centred student experience and learning as well as developing methods to structure and integrate learning. They both had to develop ways to leverage limited resources (although it should be noted that Truscott's context in the global north does have more resources available overall compared to Smith's). Both primarily learnt through engaging with others in the Engineering Education community both internally and externally rather than through formal training programmes due to the unusual nature of their modules.

As Smith had more prior experience on teaching at a large scale, she came into Module 1 with a more focused idea of the challenges of large scale teaching and had a range of possible solutions planned. Truscott had less prior teaching experience and had more general ideas on interdisciplinary and skills based teaching. This is reflected in the way each facilitator answered this question, with Truscott focusing on the mechanics of the transition from a research focused role to a teaching one while Smith focused on the decisions that would need to be made within the module to make it efficient and more grounded in Engineering.

4. *How do you see your own experiences enable you when teaching in a large scale interdisciplinary classroom?*

Both practitioners lack formal education training from their universities. Truscott draws from diverse roles across institutions and contexts, while Smith, with 15 years of teaching experience at University of Pretoria, supplements her development with external training.

They perceive themselves as active flexible problem solvers, able to design structured plans while anticipating challenges and also able to respond to issues and challenges that always arise when one runs projects at extremely large scale. In this role, an indispensable personal attribute involves possessing resilience, characterised by the ability to manage stress effectively, maintain objectivity, demonstrate intellectual curiosity and humility, take risks and embrace failure as an opportunity for learning for both students and yourself.

Both have participated in workshops and groups focused on "large-scale" classrooms, quickly recognising that these discussions typically address class sizes ranging from 80 to 200 students, which differs from the scale they operate within. Learning from each other has been more valuable than any formal or informal training they have attended across their careers.

Both acknowledge the undervalued significance of facilitation roles in academia, often overshadowed by traditional educator or researcher roles, revealing a gap in existing academic structures. While UCL recognizes the researcher/teacher split, it does not acknowledge the teacher/facilitator role, whereas University of Pretoria does not recognize any such distinctions. This lack of institutional understanding underscores the need to explicitly outline the requirements and demands of facilitation roles. Academic roles tend to compartmentalise and isolate functions, hindering flexibility. Both practitioners identify themselves broadly beyond their scientific or engineering backgrounds.

5. *What challenges have you encountered and how did you cope?*

Both facilitators encountered similar challenges, specifically regarding communication. The need for clear and effective communication with a large number of students and staff is critical, considering the scale of the cohort and the distinct student-facilitator dynamic compared to smaller classes. The smallest change or disruption at extreme scale can for example lead to 300 emails flooding your inbox overnight. Extreme scale increases the likelihood of encountering unique circumstances, requiring clear rules and processes for both staff and students to navigate effectively.

Another key challenge arises from the diverse range of student experience, knowledge, and skills in interdisciplinary projects, particularly amplified by the large scale. This requires catering to various abilities without the capacity to personalise learning journeys. Combined with the need for clear communication, this results in highly structured teaching and learning and it can limit creativity.

Extremely large-scale teaching has significant logistical challenges which need to be acknowledged and addressed creatively. The specific challenges are context dependent and both facilitators agreed that it was a large part of their role. Efficient module management to avoid excessive personal resource consumption is essential. Proxies in the classroom, such as staff members, external partners, or experienced students are very important. However, this also introduces additional challenges, including the training of these proxies and instances where they deviate from the established process or fail to grasp the intricacies of extremely large-scale teaching.

When teaching at this scale there is significantly more interaction with central administrative processes. There is an extra burden of explaining what is needed, problem solving and crisis management that is not seen in smaller modules. In these large-scale interdisciplinary modules, educational leadership takes on a distinct form, with a significant emphasis on negotiation, lobbying, persuasion, and facilitation due to the complexity of the module's components.

There are contextual differences between the two facilitators which change the emphasis of different challenges. Smith's module size is closer to what is normal at University of Pretoria and so the infrastructure is designed for a similar size. The interdisciplinary nature is not normal. However Truscott's module is extreme for UCL both in size and complexity and so UCL's infrastructure isn't designed for a module like this. Truscott has access to more resources but also has to work within more constraints than Smith does due to the structure of the faculty and the engineering programmes.

6. *What do we need from the environment we work in?*

The primary factor required by both practitioners was acknowledgement of the complexity and difficulty of running extremely large scale interdisciplinary classrooms. Administrative and logistical support from local (faculty/dept) and central (university level) teams is critical as well as awareness and flexibility that their modules might not fit their typical procedures. It is also critical to communicate any potential or pending policy or process changes as early as possible. A small change for example in a financial policy at University of Pretoria, led to delay for students' project funding for more than 4 months. It is far easier for smaller modules to fit existing policies and processes, so priority should be given to these extremely large scale modules if any changes are required or suggested.

7. *How have you extended your insights to your colleagues and institutions?*

Both facilitators have shared their insights with colleagues within their institutions as well as in national and international networks, via informal advice and support, meetings, visits and workshops. They have both started to publish on this unusual teaching role either in journals or at conferences. They have both brought their experience and expertise to the development of new programmes and the scaffolding of skills learning throughout curricula.

8. *How do you develop/prepare someone to run a large scale interdisciplinary module?*

Emphasis on facilitation skills, emotional intelligence, and ability to manage uncertainty as critical for large-scale interdisciplinary module coordinators. It is essential if possible to shadow and experience such engagements at this extreme scale to understand the complexity and chaos the coordination can be.

9. *Looking forward, what do you believe is crucial for future initiatives focused on, and how can these efforts extend beyond the current scope?*

Both facilitators agree that robust support systems for those running extremely large scale interdisciplinary team projects are crucial going forward. This includes specialised training for large-scale and interdisciplinary teaching as well as teaching of teamwork, acknowledgement of the very different role and requirements of someone leading this type of teaching and prioritisation of these modules to acknowledge and support the difficulties in logistics. Alongside support systems, institutional recognition of and action on the importance of learning these types of skills and the need for meaningful engagement from both staff and students in these activities.

4 SUMMARY

There are several key themes that can be extracted from the discussion of these nine questions. They fall into four areas, experience and identity, uncertainty, learning through doing and university support.

Experience and Identity

Diverse previous experiences, interests, and training benefit facilitators by bringing a range of skills, concepts, and methods into the classroom. This enables them to connect with students from various backgrounds. Both facilitators are naturally reflective and empathetic, shaping their teaching approach to focus on guiding and facilitating rather than instructing.

Uncertainty

Comfort with uncertainty and adaptability were emphasised throughout the discussion. Extensive planning was also necessary for the module's function, including contingencies and flexibility for change. Facilitators needed to balance planning with adaptability, being comfortable with not having all the answers but knowing where to find them.

Learning through Doing

Openness to learning and experimentation is crucial in extremely large-scale interdisciplinary teaching where no set methodology exists. Both facilitators learned primarily through engagement with other educators, internally and externally, and through trial and error rather than formal training. They now communicate their insights through workshops, papers, and supporting others. Familiarity and comfort with experimental learning processes also aid in providing better support to students undergoing similar experiences.

University support

Institutional support for the implementation of non-traditional modules and roles must recognize and address several key factors. Firstly, there is a societal demand for individuals to fit neatly into predefined categories, conflicting with the interdisciplinary nature of these modules. Institutions must accept this non-conformity and support module leaders without expecting adherence to conventional stereotypes.

It is also critical that there is adequate agreement and support from both the faculty or department level and central university teams to ensure seamless coordination and operation. Robust logistical processes and clear communication channels are essential to navigate the complexities inherent in these roles. Managing the intricate relationship between central systems, students, and staff further underscores the need for comprehensive institutional support.

Global North/Global South

The differences between the Global North and Global South pose challenges when coordinating interdisciplinary, large-scale modules. These disparities include our starting points, the conditions we work with, and the political situations in our institutions. Even the facilitators themselves face context-specific differences that influence how we adapt our approaches. Understanding and addressing these variations is essential for successful coordination, ensuring that our efforts meet the diverse needs and conditions in both regions.

ABSTRACT

Engineers Without Borders UK is running a Systems Change Lab as part of the Royal Academy of Engineering's wider policy project, Engineer 2030 which aims to rethink engineering and technology skills for the 21st century. To date, more than 200 people, and over 25 universities and 22 companies, have participated in the Systems Change Lab (which launched in September 2023) exploring and testing how and why to integrate global responsibility as a central feature within university engineering education. The purpose of the Systems Change Lab is focused on enabling systemic change within engineering departments and to contribute towards a resource for universities to drive the change towards reimagining engineering degrees. This paper shares the approach and preliminary observations behind the Systems Change Lab to support changemakers exploring how to enable systemic change within engineering departments and to contribute towards a resource for universities to drive the change towards reimagining engineering degrees. We share the outcomes of bringing together a diverse mix of change makers who shape engineering degrees, including deans, heads of department, educators, accreditors,

[1] *J. Truslove*

industry players and current and past engineering students, to connect, test prototypes, work together and build momentum behind improving engineering degrees.

1 INTRODUCTION

1.1 Context

The 21st century is confronted by a host of rapidly evolving and interconnected global challenges, from climate change and resource scarcity to the risks imposed by accelerating technological advancements and public health crises (World Economic Forum 2024). Global responsibility in engineering underscores the need for critical reflection on the role of engineering in society and its effects on people's well-being and ecological stability (Engineers Without Borders UK 2023; Royal Academy of Engineering 2024). The need for engineers to embrace global responsibility has long been recognised (Kamp 2020) and now comes through as a central message of a new initiative called "Engineers 2030" catalysed by the Royal Academy of Engineering (2024). It involves a comprehensive understanding of the social, environmental, and economic impacts of engineering, both locally to where engineering is practised and globally through supply chains and operational outputs. Yet coverage of sustainability, inclusion and ethics across engineering degrees remains insubstantial and inconsistent. For example, A 2022 survey of 667 students revealed that only around 30% had so far encountered the UN's Sustainable Development Goals in their education (Siemens 2023). Further, industry and professional bodies in recent years have stated that 'engineering degrees are not fit for purpose' (Flaig 2022) This has alarming repercussions for the workforce. Recent studies emphasise this skills gap whether it is the capability to deliver on industry sustainability strategies (Institution of Engineering and Technology 2021), decarbonisation and meeting net-zero targets (EngineeringUK 2022).

1.2 Background

Navigating the complexities of educating the next generation is no easy feat. This involves questioning 'how' and 'why we teach, and how to engineer with deep consideration for the broader impacts of engineering on people and the planet. Resources such as Doughnut Economics (Raworth 2017), the Three Horizons Model (Sharpe 2013) and the Systems Bookcase (Broadbent and Norman 2023) help articulate the importance of change and what it can look like. There is also a growing need and movement to design curricula in a way that maximises interdisciplinary collaboration reflecting real-world contexts (Graham 2018; 2022, Kolmos 2024). For example, two existing approaches that aim to challenge existing engineering educational structures and traditional forms of teaching practice are problem-based learning and the CDIO initiative. However, ultimately, successful adoption rests on those who want to introduce any change (Edström and Kolmos 2014). Indeed, the people who deliver and shape the education of the next generation of engineers have great influence to enact transformative change towards integrating global responsibility as a core tenant of engineering education. However, educators are influenced by what they know, how they approach pedagogies, and their attitude and mindsets about what to do. Successful improvement in teaching often hinges on the emotional and cultural journey taken by an institution to create change (Goldberg and Somerville 2023). What is undoubtable is that systemic change is not done in a silo. It is complex, interconnected and collaborative and which can't proceed with the same fragmented approaches we've used in the past (Purcell and Fraser-Haddock 2023). Drawing on wisdom from those who have successfully instigated positive changes within degree programmes is valuable in an organised and collaborative way to achieve real change.

Recognising this need, Engineers Without Borders UK and the Royal Academy of Engineering jointly established the Systems Change Lab. The Systems Change Lab is an experiment to support changemakers exploring how to enable systemic change within engineering departments. The lab explored why and how to integrate global responsibility as a central feature within university engineering education and provided a space to go deeper on specific interventions to develop shared learning and experience. This collaborative initiative is poised to support change-makers to deliver change in UK universities over the coming years.

2 METHODOLOGY

The aim of the Systems Change Lab was to build momentum by continually expanding this growing network to identify key levers of change by providing a space to mobilise and collaborate - with the logic that this can bring about widespread change at scale. The ground rules for the Lab were developed based on four guiding principles for global responsibility - responsible, purposeful, inclusive and regenerative (Engineers Without Borders UK 2023):

- All events (virtual or in person) will be active, and participatory, involving a mix of individual reflection, work and group discussion as well as co-creating resources to support universities to keep degrees relevant to the challenges of our age.
- All events are designed to make sense to those attending all, and to newcomers. The Lab will be open and free to attend or to participate in events for those who are interested in making change, and will provide flexibility in how people contribute (by attending events or in the online collaborative workspace).
- To recognise those (that want to be) that actively contribute to outcomes and outputs, by listing them as contributors and showcasing individuals.
- Encourage participation from teams of people from a particular university so they can represent the various roles and influence.
- To host both in-person and virtual events and explore options (if it continues beyond March) to run events outside of London. To also draw on insight gathered through other groups, experience or research.
- The journey is most important - and this is not an individual event. They are part of a path connecting to a greater outcome.

Social Innovation Canada's online definition of different types of Labs (see sicanada.org/knowledge-hub/sig/labs/), was useful in establishing the Systems Change Lab e.g. "*Change Labs tend to emphasise building collaboration and shared understanding between participants in the lab as the basis for shared action(s).".* Further, Kahane (2010; 2012) describe a step process for running change labs (co-initiating, co-sensing, co-presencing, co-creating, co-evolving), who's insights were also influential in developing the approach for the Systems Change. Sessions brought together 200 participants consisting of all the groups who shape engineering degrees, including deans, heads of departments, educators, accreditors, industry players and current engineering students between September 2023 and March 2024 - in-person (15 September 2023,11 December 2023) and virtually (30 October 2023, 3 November 2023, 9 January 2024).

Part of the purpose of the Systems Change Lab was to contribute towards a resource for universities to drive the change towards reimagining engineering degrees. The Reimagined Degree Map supports engineering departments in navigating the decisions that are urgently required to prepare students for 21st-century contexts (Engineers Without Borders UK 2024). Active, facilitated and participatory methods were used for each session including workshops using preliminary exercises of the Reimagined Degree Map (to test and gain feedback to shape the resource. Fig.1 shares an example of a visual tested by the lab), guided Q&A and focus groups to share perspectives and ideas for future collaboration, build relationships and actively contribute to systemic change in engineering education.

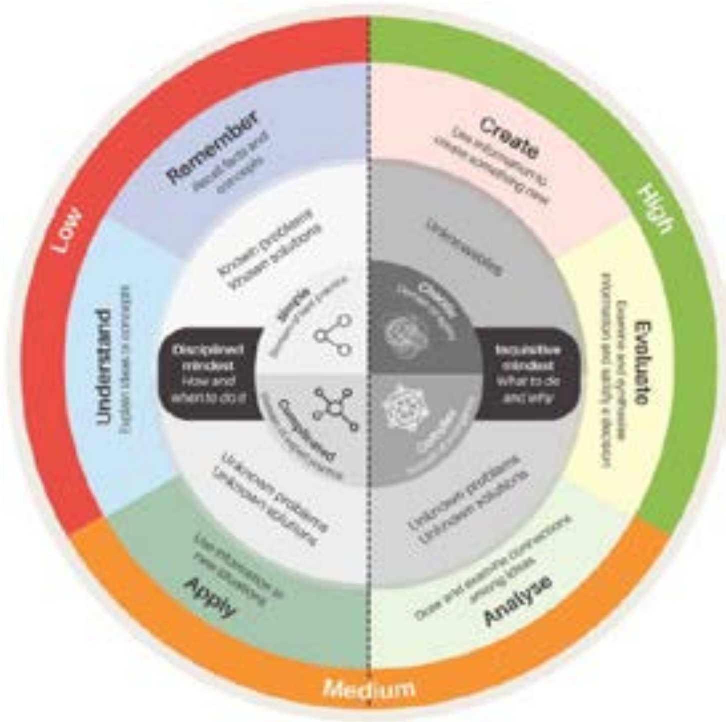

Fig. 1. Rebalancing learning within degrees to be relevant to the future we face. The left hand side is generally taught within engineer degrees today, yet we need more on the right hand side to equipe engineers for 21st century challenges. (Engineers Without Borders 2024)

3 OBSERVATIONS AND RESULTS

While change occur in individuals own teaching practice, decisions taken by people at every level of universities shape the content of a degree and the resultant student experience. Change at pace and scale requires a collective approach to catalyse efforts to drive and sustain a culture of continuous improvement and to effect change at pace and scale. Empowering people to act at all levels is key, as is developing a shared direction and strong ambition across a department or faculty.

3.1 Observation #1: Most universities do not integrate global responsibility but want to

From surveys conducted during the Systems Change Lab, participants were asked where they rank their university in teaching global responsibility. While the majority replied in a non-integrated way (as a separate topic or module), the same group would like to see a shift towards achieving an integrated approach to embedding global responsibility across their degree. This result has been mirrored when Engineers Without Borders UK has engaged engineering educators across the UK.

Table 1. Results from 62 participants of the Systems Change Lab in September 2023

Level	% of participants rank their universities	% of participants rank where they want their universities to be
Continuous Improvement - Aim to be globally responsible in all we do, at the institution or programme level. Emphasise societal context, enabling active learning and open-ended projects.	13	58
Integrated - Teach global responsibility as a core part of our engineering degree(s).	26	42
Add-on -Teach about global responsibility as a separate topic, module or course, not a core part of our engineering degree(s).	45	0
Ad hoc - No focus on educating Global responsibility or, it's patchy, i.e. a fragmented focus on sustainability, ethics and inclusive approaches to engineering.	16	0

3.2 Observation #2: *Empathy map of those with strategic oversight of engineering degrees within a UK university*

In January 2024, the Systems Change Lab was split into 3 groups, each with a trained facilitator for an empathy mapping exercise to listen to people who are making change - how they think, feel and what they need, and to deeply consider what might need to be invested in to support teams to adopt and adapt to the change.

Table 2. Exert from Empathy Mapping to consider what a person with strategic oversight of engineering degrees within a UK university might say, feel, think or do.

Says:	Feels:
• I have pressure to deliver better with less resources than in the past. • If we are going to add in more content - what do we leave out? • Students and accreditation demand this.	• Pressure to attract more students. • At risk of burnout from juggling too many commitments and pushing against resistance to change.

• Much of this work is about changing values and habits, and contextualising what we do as engineers. A lot of our existing content will fit within this new frame - but we need to step back.	• Sad when it's the students who want more traditional approaches which can be a bit disheartening. • Worried that staff (other educators) will not come on this journey to improve degrees. I want to make change but it's difficult to get everyone onboard.
Thinks: • Can I afford to invest in this change? Can I afford not to? • Change requires a lot of work. Oddly, it doesn't require a lot of work to teach better. • Staff are overloaded already - who will be doing? • Sustainability is the new Health and Safety - and as such is a mindset/behavioural change, not a topic in itself - are we approaching it the right way?	Does: • Sets course offerings and responsible for administrative processes. • Balances demands of many people • Works hard to get programmes where they are today or accredited. • Works with other departments and disciplines who share resources, staff and modules. • 80% of my effort is on reassurance, re-explaining and justifying my strategy over and over again.

Four main themes emerged from a 45-minute empathy mapping session with approximately 40 educators. The first theme was concern for the capacity or capabilities of educators. The second theme was connected to feelings of overwhelm or emotional willingness for change. The third theme was statements that related to a feeling of pressure and seeing this as an opportunity. The fourth theme was an appreciation of the complexity of the task of ensuring degrees are designed for the 21st century. It is important to validate the experiences of educators and navigate ways to meet their needs sensitively, whilst centring the focus on what is best for today's students.

3.3 Observation #3: Shared barriers and enablers of change

To deliver systems change, you must enable others to make changes. We explored barriers and enablers that make change possible that have emerged from the Systems Change Lab.

Table 3. Major barriers and enablers identified from 200 participants of the Systems Change Lab in September-December 2023

Major Barriers:	Associated Enablers
Slow Pace of Change: Risk of taking 5-10+ years to modify degree courses, risking global responsibility not being a core part of the education of over 250,000 graduate engineers from now to 2030. **Rigid Processes:** Current change processes hinder swift	**Outcome-Focused Funding:** Explore outcome-based funding models for education; align with graduation outcomes. **Shared Vision:** Clarify that this shift is a priority across departments. **Flexibility in Change Management:** Shift towards a more flexibility in change management process with quicker approvals for modifying degrees.

modifications; calls for flexibility and quicker approvals. **Lack of Incentives:** Insufficient motivation and support for educators to adapt teaching methods or integrate sustainability **Management Attitudes:** Leadership buy-in crucial; interventions needed at department and faculty levels. **Interpretation of AHEP 4:** Ambiguity on whether AHEP 4 mandates modular changes in ethics and sustainability. **Skills Upskilling:** Need to translate (with clear and consistent narratives) the need to develop engineers' adaptability into what this means for the structure of future-focused degrees, balance of learning offered and pedagogies.	**Cross-Department Collaboration:** Invest in resourcing cross-department, specifically focused on improving education. **Nurture a community of active change makers** to share resources and experience between student-led change initiatives and academic-led. **Invest in developing educators**. Provide flexible pathways for academics to develop themselves as strong, passionate educators, and to also not teach if their capabilities or motivation is best aligned to research activities. **Recruit educators** with relevant skills and experience of innovative teaching approaches. **External Expertise:** Connect with wider university expertise and external partners; bring in interdisciplinary perspectives. **Continuous Development:** Invest in educators' continuous development; support retention through career progression. **Storytelling for Change:** Showcase impactful stories of change; lead by example for normative shifts. **Clear Narrative:** Consolidate foresight for student engineers' future needs; prioritize team literacy and diverse skills.

Uncertainty about what change is needed, what knowledge is needed to deliver, and what support is available to enable change are all challenges that have emerged from the Systems Change Lab, while sharing examples of what works and creating ways to help educators lead and make change, are seen as effective enablers for change.

4 OUTCOMES

The learnings from the Systems Change Lab, have been translated into a Reimagined Degree Map, a free guide launched publicly in March 2024 (Fig.2). Over four hours, the Map will guide users through a six-step journey that will enable users to reflect on the needs of modern learners and the approaches for contextualising 21st-century challenges within curricula. The Map is intended to facilitate constructive conversations and engagement with a diverse group of people to shape degrees collaboratively. In particular the Map has been designed and structured in the following ways:

- **Sets out actions to develop shared intentions across a department:** The guide is designed to be used as a time efficient process to help people navigate what decisions to make and to help with imagining how a degree could be improved. It is structured as a collaborative process that can be used again in the future.

- **Provides agency in how to navigate complexity:** The guide was designed as a "choose your own adventure" format to help users navigate the change required in a non-linear way - and find what is most useful at that moment for them. Sections and worksheets within the Map are designed to feel bitesize - without being superficial – where they are set out like destinations of where people navigating may arrive at.
- **Can be used with a wider "change team":** We know no one person can enact long-lasting positive changes across an engineering degree. Using the Map to strengthen ambition, relationships and having various roles who contribute to navigating systemic change across a department(s) is key.
- **Driven by the needs of educators and to centre decisions on what is best for students:** The intended outcomes are to support engineering departments to navigate the decisions that are urgently required to prepare students for 21st-century challenges, whilst sharing content within the guide specifically aimed at educators that are connected to a range of practical initiatives and resources such as the IDEO framework, the Engineering for One Planet Framework of essential sustainability learning outcomes, and the UK Engineering Professors Council’s Sustainability Toolkit.
- **Being less about teaching better, and more on how to better change or adapt:** The guide supports users on how to unlock better strategic decisions that lead to the improvement of engineering degrees to better align and connect with 21st century challenges.

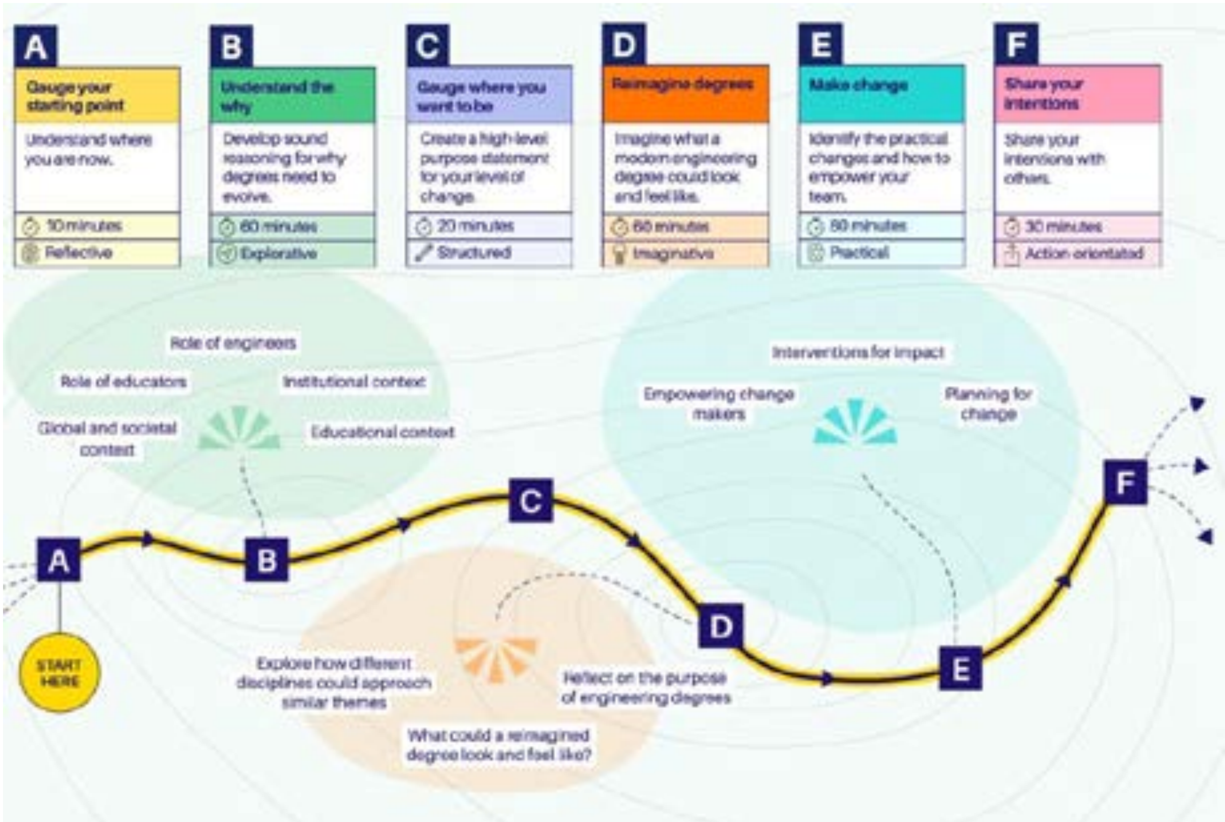

Fig. 2. Reimagined Degree Map (Engineers Without Borders 2024). Worksheets A-D will help you to create a shared vision. Worksheet E is about deciding the practical changes you can make. Worksheet F will support you to share your intentions.

5 CONCLUSIONS AND NEXT STEPS

The purpose of the Systems Change Lab was stated as being "focused on enabling systemic change within engineering departments". This growing community associated with the Systems Change Lab has already demonstrated how useful it is to being a test for positioning and developing content of new resources to support positive change (e.g. Reimagined Degree Map). It has highlighted the potential of greater collaboration to shift the dial in terms of integrating global responsible meaningfully into engineering degrees across universities. It is clear that without connection to others in a similar role, early adopters can feel frustrated. Yet they are critical to continuing the trend of a greater emergence of a generation of leaders of engineering education with the capacity to deliver student-centred curricula at scale. We know that some see the change as long overdue, yet for some, any move towards integrating global responsibility (e.g. teaching social justice alongside thermodynamics for engineers) might feel incredibly radical to those who were educated in the past or to those that set the scope for engineering degrees. It is important to validate the experiences of educators and navigate ways to meet their needs sensitively, whilst centring the focus on what is best for today's students. Arguably, the Systems Change Lab could be an effective way to navigate this dynamic. Engineers Without Borders UK is actively exploring the future of the Systems Change Lab, is seeking supporters to continue the Lab, and encourages adoption, promotion and for users to share stories of change through using the Reimagined Degree Map.

ABSTRACT

The paper describes the development process of a Pan-European Citizen Lab initiative driven by the European University of Technology (EUt+) alliance. EUt+ is a consortium of nine institutions that was selected as one of the European University Alliances by the European Commission. The partners are all technological universities from across Europe. Our vision is that the co-design of the Citizen Lab based on an analysis of societal needs will foster user-driven innovation. The expected impact will be an increased participation of citizens, an increased awareness of research, and social issues addressed at the community level. To achieve our vision, we have chosen Action Design Research (ADR) as one of the main tools for the creation of the Citizen Lab. ADR is a design research methodology that considers both technological and organizational contexts, shaping artefacts (innovations) through design and use, including users and researchers in the

[1] Mr. Valtins Karlis
Karlis.Valtins@rtu.lv

process. Originally focused on the IT knowledge domain, ADR was not originally designed to co-create innovations for diverse users in ecosystems, the EUt+ consortium views ADR as a highly promising hypothesis that needs further adaptation and verification for this new purpose.

1 INTRODUCTION

1.1 European University of Technology and Needs Analysis

EUt+ is an alliance of nine institutions that was selected as one of the European University Alliances funded through the 2020 Erasmus+ call. Its members are all technological universities from across Europe, diverse in culture and historical trajectories, that share the commitment to form new generations of European citizens and empower them with the mindset and appropriate skills to serve society. For this, EUt+ aims to develop a new model of a university: one that requires a fundamentally novel approach to technology, deeply integrating humanities and social sciences in the way education and research are performed. The objective is to ensure that the people EUt+ trains, the research EUt+ undertakes and the innovations EUt+ fosters are geared towards real societal impact by addressing global challenges. The transversal approach to EUt+ is one of co-construction. The hypothesis underlying it is that “adequate design” of the university of the future can only be achieved through considering the real needs and concerns of the people involved: first by understanding the needs, then by the active participation of the people in the co-construction process. This transversal co-construction approach of EUt+ has laid the foundation of its Citizen Lab. The needs analysis upon establishment of EUt+ revealed that all the knowledge and know-how that the partner institutions possess, and pool together could be put to the service of the socio-economic fabric of Europe to keep proposing new products and services to our evolving societies in a citizen-led way. It is envisaged that the model for the Citizen Lab that will be created in EUt+ will be easy to replicate, multiply and connect with other European Universities in the making.

1.2 The Experience of other Living Labs

Observing the largest network of Living Labs in Europe (ENoLL) which consists of 155 active members from 37 countries, it is clear that a Living Lab is seen as a local community of practice that focuses on co-creation, rapid prototyping, testing and scaling up innovations and businesses (ENoLL Living Lab community Members Catalogue, 2023). In the EUt+ context, the Citizen Lab is seen as a community of knowledge where the joint formalization of learning is the most important outcome that can initiate, transform or lead to a practical application, but the primary outcome in its initial stages is joint knowledge creation with scientific merit. There are existing European Commission funded projects that foster creation and bring together Living Labs from EU and non—EU countries, a good example being project GRANULAR that is addressing topic of better understating rural areas by opening 7 new Living Labs and 9 Replication Labs (Project Granular, 2024). Community building is at the core of the EUt+ mission and we seek not to anchor Citizen Lab in one particular country of EUt+. In contrast to the clustering policy of Living Labs, EUt+ aims to develop a more integrated, joint European community space. A Typical model of a Living Lab includes similarities to the ADR methodology – joint problem searching and development of interventions or solutions to these problems. In that context ADR adds the dimension of formalization of learning in search of also theoretical and scientific artefacts, that would allow a community of knowledge to be established in an international setting. By fostering a culture of cooperation and knowledge exchange, EUt+ aims to bridge the gap between technological innovation and societal needs. Central to this effort is the strategic partnership with a variety of organizations, educational entities, associations, etc. The wealth of expertise of EUt+ in participatory and collaborative approaches are integral to our ways of doing research. The University of Technology of Troyes' Living Lab (Living Lab ActivAgeing, 2020) exemplifies a participatory design lab which employs a multidisciplinary method to create solutions that empower vulnerable social groups, actively engaging them in the innovation process. Moreover, the European Culture and Technology Laboratory (ECT Lab+, n.d.) established within the EUt+ framework promotes transdisciplinary and multidisciplinary approaches, integrating humanities and social sciences into research. The Cyprus University of Technology has also embraced the Citizen Lab concept as a crucial methodology to narrow the gap between research activities and the public. This approach aims to not just draw citizens closer to current research but to actively integrate their viewpoints into the research processes. Adopting this approach enables universities to foster an inclusive research environment that values community input and reflects its needs and aspirations, thus boosting the relevance and impact of their efforts.

1.3 Vision of a Pan-European Citizen Lab

Citizen Labs resemble other collaborative laboratories dedicated to the production of open knowledge that have emerged in the early 21st century, such as the European Living Labs, and certain community workshops for digital production, the Fablabs and Makerspaces. The Living Lab is a new research area that introduces new ways of managing innovation processes viewed both as innovation milieu and an innovation approach (Bergvall-Kåreborn & Ståhlbröst, 2009). The main distinction between a Citizen Lab and a Living Lab is the former’s connection to a social movement that sees the commons as a path to build societies geared towards overcoming the hegemonic economic model: capitalism at its neoliberal stage (Savazoni & de Andrade, 2019). A Citizen Lab is therefore about creating knowledge and about creating commons, respectively “for society” and “with society.”

The design and methodology applied within the Citizen Lab should include a range of activities, guidelines, tools and principles that will support design-based and user-driven innovation. The international perspective of operating the Lab in more than one EU country presents technical challenges in connectivity that must be addressed. The suggested use of the ADR methodology discussed in this paper can mitigate this concern through its adaptability to an online context.

2 METHODOLOGY

2.1 Action Design Research

In order to answer the needs mapped out within the first chapter, EUt+ has chosen Action Design Research (ADR) as a promising framework to develop a Pan-European Citizen Lab model. ADR originates from the Information and Technology field and was first introduced by Sein et al. (2011) as a design-research method for generating prescriptive design knowledge through building and evaluating ensemble

IT artefacts in an organizational setting. It has four stages and seven principles (see Figure 1) that lead from problem formulation to building, intervention and evaluation while concurrently reflecting and learning and then finishing with the formalization of learning with generalized outcomes. The aims set for the EUt+ Citizen Lab correspond to the design science; as defined in Hevner et al. research there are seven guidelines for Design-Science Research: design as an artifact, problem relevance, design evaluation, research contributions, research rigor, design as a search process and communication of research (Hevner et al., 2004). This outlines the ties between technology, design science, organizational context and problem solving.

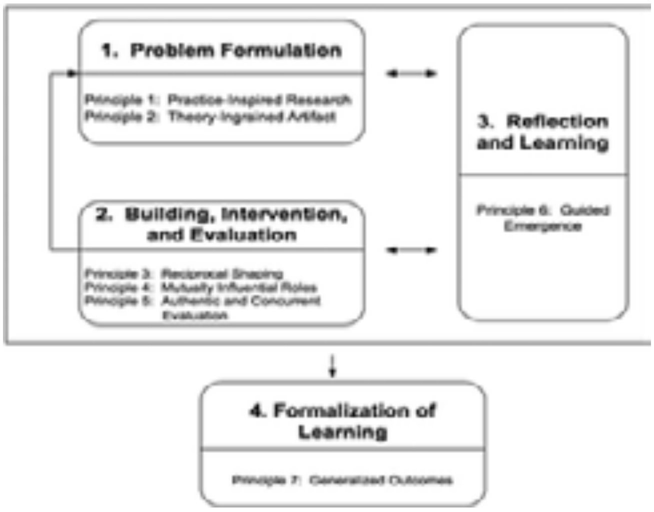

Fig 1. ADR stages and principles (Sein et al., 2011)

The ADR Method has been developed upon a technological premise and by the assumption that most problems today could have a solution or innovation that involves technology. This is a promising foundation for the application of ADR in a Citizen Lab. User-driven innovation has been set as a key drive for the Citizen Lab and should be considered an innovation environment, which can be characterized as a place where open innovation and technology are boosted (Baierle et al., 2021). As Bigliardi et. al. (2021) has pointed out in an extensive open innovation text mining research study, there are nine thematic clusters that correspond to open innovation research – context dependency, collaborative frameworks, organizational dimension, performance and success, external search and specific fields of open innovation. The majority of these correspond to the gap analysis of our Pan-European Citizen Lab; namely, that actions of citizen science should be context-dependent, form collaborative frameworks, consider the organizational dimension and there must be a technological element present. Thus, open innovation in a user-driven setting assisted by technology is the most appropriate approach in creating a Citizen Lab. However, it must be emphasized that the focus should not be on technology more than on people (Marek, 2021) as it could produce negative results. It is important to first and foremost consider the needs of the participants (citizens) as technology serves an auxiliary purpose to enhance the participatory nature of the Citizen Lab. Mark Bilandzic and John Venable in 2011 proposed a new research method called Participatory Action Design Research for studies in Urban Informatics that reflects upon issues across social, technology and design-oriented sciences applied in the urban context. Their research highlights the contrast between Information Systems and Urban Informatics, the latter being more social and open and, in a sense, universal. While ADR has become widely accepted as a prominent research method within the field of IT, several scholars have reported a lack of guidance of method support at the micro level. Stefan Cronholm and Hannes Göbel in 2022 brought forward an empirical Action Design Research project that supports project managers in this regard. This research provides support for ADR at the micro level for all its stages: procedural support, guiding concepts, and various techniques for the documentation of project tasks. They argue that is essential to integrate method support at macro and micro levels and these can be described by three guiding principles: 1) relationships between normative and prescriptive method support should be identified; 2) continuous shift of focus between the whole and its parts should be supported; 3) completeness of ADR in action must be ensured (Cronholm & Göbel, 2022).

2.3 Contextualization of the Citizen Lab

As foreseen in the inception phase of the EUt+ Citizen Lab, the Lab would not be fixed on one particular theme and would be based on the research expertise of the partner institutions. Hence, the Lab should operate in versatile ecosystems. Open Innovation Platforms (Rho et al.,2021), Service Ecosystems (Trischler et al.,2020), Ecosystem Strategies (Altman & Tushman, 2017) and various clustering policies address the issue of contextualization for the ecosystem encompassing the problem and citizens in question. Therefore, we have chosen to create separate user-driven innovation schemes that would include the following characteristics: generic problem, specific context, core partners and empirical evidence. When these characteristics are defined, a user-driven ecosystem will emerge and bring together active citizens, researchers, and other interested parties as participants. The participants will interact in participatory workshops (online and face to face) and desk research while going through the Action Design Research stages, which will lead to formalized learning for both practical and knowledge merit.

3 RESULTS

3.1 Citizen Lab in Practice

Since participation and experimentation are among the indicators that are to be examined to assess the societal impact of EUt+, it is necessary to evaluate the different levels and conditions of stakeholder participation in the numerous European Research Institute test beds. However, determining the impact of stakeholder participation is not easily achieved. The problems met by the practice of societal impact assessment have been identified (European Commission, 2005). These two different ways of doing research, focusing either on scientific impact, characterized by the academic interests of a scientific community, or on societal impact, have been described as “Mode 1” or “Mode 2” science (Gibbons et al. 1994). The assessment of societal impact of research is difficult compared to the assessment of scientific impact. For societal impact assessment, a commonly accepted framework is still to be constructed. This is precisely the contribution of EUt+ Citizen Lab through using ADR methodology; namely, ADR provides the necessary structure for the Citizen Lab to be replicable. The first test of applying ADR methodology in the EUt+ Citizen Lab consisted of an in-person participatory workshop at the SEFI Spring School 2024: Democracy in Engineering Education at the Technical University of Berlin (April, 2024). During this workshop, a group of Spring School attendees participated in a test of the first phase of ADR: problem formulation. The goal of this Citizen Lab workshop was to identify the value gap between three sectors: sustainability education, institutions and the citizen sector. Due to time constraints, the focus of this workshop was limited to the first phase of ADR. During the SEFI Spring School test, it became evident that participants require clear activity objectives to successfully move through the first phase of ADR. Without a continuation of the subsequent phases of ADR, the participants did not understand the purpose of the activity and struggled at times to engage in problem ideation. Following the experience of the first attempt to implement ADR during the SEFI Spring School, a pilot of the Citizen Lab was carried out in June 2024 online. This activity was adapted to fit an online environment using video conferencing and online participatory tools to address the Pan-European aspect of the Citizen Lab. Learning from the experience of the first test of the ADR Citizen Lab at SEFI Spring School, it was determined that the full cycle of the Citizen Lab would take at minimum three workshops; the first focused on phase one of ADR: problem formulation. The second workshop allowed participants to delve deeper into collaborative speculative ideation, formulating concrete action points for intervention during phase two of ADR: building, intervention, and evaluation. Finally, participants engaged in a third workshop focused on phase three of ADR: reflection and learning. In this phase, participants continued formulating an action plan for interventions revisiting the issue formulated in workshop one and the ideal solution proposed in workshop two.

The second pilot of the Citizen Lab took place over the course of two days with the first and second Citizen Lab workshops combined into one day and the third workshop on the following day. In total, there were eight participants representing five European countries: Latvia, France, Ukraine, Georgia, and Cyprus. The participants were students and recent graduates. Each workshop was 1.5 hours long. The first and second workshops were combined due to participant availability constraints. The workshops were facilitated by two moderators, since participants were split into two breakout groups. The Citizen lab workshops continued on the subject initiated in the SEFI Spring School – Democracy in Higher Education. Applying the three elements of ADR method, it was possible to gain insights of the full cycle of ADR and how it will be further used within the EUt+ Citizen Lab.

Fig. 2. Contributions of participants from first and second online workshop

The first and second workshop was set to address two key elements within the ADR method – problem formulation and building potential intervention while concurrently reflecting on the process and opinions. During the session participant inputs were gathered in a free form of sticky notes within a Zoom platform whiteboard (see

Figure 2). Participants were spilt in two groups where they worked on sharing their empirical knowledge, experiences, and opinions.

Fig. 3. Contributions of participants from third online workshop

The objective of the final online workshop was to formalize the learning from the first workshop, reflect on the knowledge that was shared and generated to proceed with outputs that can have practical or scientific merit. During the third workshop participants worked on a Value Taxonomy for Democracy in Higher Education (see Figure 3 on the left) where each participant formalized their individual learning from the first workshop into a specific value, clustering together rubrics discussed in the first workshop. As a continuation of the formalization of learning participants worked collaboratively on a generalized implementation plan draft (see Figure4 on the right).. By structuring the formalization of learning it was possible to see cross-country opinions and experiences that were synergized together in a single chartThe outcomes of the three online workshops suggest that:

1. ADR method was applicable and helped to structure engagement with citizens in an international setting.
2. Format of online workshops is a valid Citizen Science approach when dealing with participants from more than one country.
3. It was possible to formalize learning in the shape of knowledge creation for scientific merit (outputs from the third workshop).
4. A smaller group of participants (8-10) is optimal for effective and fruitful online collaboration.

The participants were asked to fill out a short survey once the three workshops were completed. They reflected that opportunity to express their opinion was sufficient, in addition, a few organizational improvement suggestions were made (example: for future workshops to use slides for the introduction part). The team of facilitators from the EUt+ consortium also discussed and reflected on their experiences from the workshops, outlining the overall success, but also addressing future improvements – two facilitators necessary for each group, a more structured scenario, time keeping. It is necessary to facilitate a clear separation of each phase and its specific objectives. It is also necessary to reconsider the language used in the workshops:

the ADR terminology should be adapted to participant needs. Adjusting the language used in the workshops (e.g. “Problem formulation” could be changed to “Issue exploration”) can help manage participant expectations and guide the discussion in the right direction. It is also important to be transparent with the participants and clearly indicate what outcomes they can expect from the workshops: the EUt+ Citizen Lab is still at its primary stages and any subsequent workshops must indicate the self-reflective, research-driven nature of these initial iterations of the Lab to the participants.

4 DISCUSSION

Observing outcomes of the three online pilot workshops, it is possible to approve ADR as suitable methodology to be used within EUt+ alliance for development of the Citizen Science through a Citizen Lab. Connecting theoretical aspects of ADR with the practical knowledge gained during the seminars there are further developments to be done toward the practical implementation links of the outcomes generated, which most probably can be achieved by bridging the EUt+ Citizen Lab with other local communities of practice within the EU. The main merit of the full ADR cycle contributes the most to the formalization of learning that can reveal scientific artefacts that can be further used by the research community while also giving credit to the active citizens and stakeholders that participate in Citizen Lab activities. To be able to fully convert these outcomes into practical, tangible outcomes, a link with other external communities (representing the respective ecosystem) must be made. A solution to this could be enrolling EUt+ Citizen Lab within the ENoLL network, to collaborate with other University Alliances or, alternatively, involving participants who are already established within a community of practice in Citizen Lab workshops. In regard to the ADR method in practice – it works well if facilitators have understood the mechanics of ADR methodology, the sequence of processes and, most importantly, the formalization of learning section. Further gathering of data is needed to establish a common, replicable and practical use of the ADR method for upscaling of Citizen Science within the EUt+ alliance.

5 CONCLUSION

EUt+ Citizen Lab has proven ADR as suitable methodology that will be kept for future Citizen Lab activities. At the same time, the pilot test showed the improvements that are needed for the online international interactions (majority of them being related to organization and facilitation). As defined in ADR method, there were several artefacts found during the pilot test – refined terminology of identified challenges by participants, ability to switch between macro and micro levels of themes, channeling of knowledge between groups. EUt+ Citizen Lab will keep developing with the emphasis on co-design and co-creation, facilitated by the partnership with diverse living labs and the strategic use of economic and social tools ensures that the Citizen Lab initiative is a vibrant and inclusive platform for innovation and Citizen Science. As we move forward, our focus remains on strengthening these connections and expanding our community, guided by the vision of fostering a more engaged, informed, and capable generation of European citizens.

ABSTRACT

Integration of competencies ensures that students are better prepared for their future career in higher engineering education. One way to integrate competencies into a curriculum is by developing a learning path together with teachers, which is guided by an overarching system of reflection. In this paper, it is described how learning paths can be designed together with teachers. Furthermore, a design for an activity which stimulates the development of competencies is given. This activity comprises a meeting related to competencies and subsequent reflection assignments, in which students write down a take-home message, reflect on their competency development, and set goals. Students upload their reflection assignments and goals in their portfolio, to be able to monitor their competency development. Two examples of integrating competencies in the bachelor Food Technology at Wageningen University are presented. First, the design of the learning path *researching* is discussed, including an example of an activity that addresses this competency. Second, a course is introduced in which students reflect and set goals on their competency development, which they upload in their portfolio. The presented approaches and examples serve as an inspiration to integrate competencies in an existing programme.

1 INTRODUCTION

Students in higher engineering education should develop competencies to ensure that they are prepared for the current complex challenges in the world (Gerstein and Friedman 2016; Rieckmann 2012). Competency development can be fostered through integrating competencies into the curriculum of a study programme at the university. This implies competencies being developed and explicitly taught within the discipline, in addition to an emphasis of development on discipline-specific knowledge (Huijser et al. 2008; Chadha 2006).

1.1 Integration of competencies in a curriculum

To integrate competencies into a curriculum, three factors are of importance: a learning path, reflection moments, and teacher commitment. First, competencies should be integrated through establishing learning paths related to competencies across courses (Levander and Mikkola 2009). A learning path is a selection of courses in which the integration and development of a certain topic or competency is aligned and monitored throughout all courses of a curriculum. Learning paths ensure the integration of competencies through providing several opportunities in courses for students to apply them. Students start practicing these competencies on a basic level and as they progress through their study, the complexity and difficulty of the competence increases (Van Merriënboer and Kirschner 2017), resulting into a greater understanding and independence (Reekie et al. 2023). Specific learning outcomes related to competencies should be defined and included in the list of learning outcomes of a course, to ensure that the learning path is visible for both students and teachers, competencies are addressed explicitly and therefore have become a main component of a course. This makes both teachers and students aware of the presence of competencies in courses and coherence with other courses.

Second, the integration of competencies is stimulated through types of self-assessment, such as reflection moments (Virtanen and Tynjälä 2019). Through reflecting, students are stimulated to become aware of their competency development and will actively work on it (Wijngaards-de Meij and Merx 2018). They will recognize the importance of their development, which engages them in their learning (Mello and Wattret 2021). The explicitness and visibility of the development of competencies, as described above, encourage these reflection moments.

Third, to successfully integrate competencies into courses, teachers need to be involved in this change, so that their strengths can be used and they are committed to the change (Potter and Devecchi 2020). Therefore, it is important to have discussions with teachers how to integrate competencies in their courses and curriculum in general. Discussions with and among teachers can lead to valuable ideas for new learning activities. Furthermore, it makes teachers aware of the position of their course in the curriculum and therefore stimulates alignment between courses (Bath et al. 2004).

1.2 Selecting competencies in Food Technology

A proceeding step before integrating competencies into a programme is selecting competencies to be integrated. Each study programme has different needs and a different starting situation with regard to competencies. Here we shortly describe how this selection was done for the bachelor programme Food Technology at

Wageningen University (WUR), a three-year programme in which, until recently, competencies have been integrated more implicitly than explicitly. To find out which competencies need more attention, a research was performed through conducting surveys and interviews with students, graduates, teachers and other stakeholders. Four competencies were identified to need more attention in the bachelor programme: *analytical thinking*, *critical thinking*, *problem solving*, and *decision making* (Van Berkum et al. 2024b). In a follow-up study (Van Berkum et al. 2024a), the presence of these selected competencies was mapped through curriculum mapping. First, through using the outcomes of the interviews, sub-competencies were defined, which are components of the competencies described before. Subsequently, teachers were asked to complete a matrix, in which they were instructed to indicate the presence of these sub-competencies in their courses. This study resulted in a visualisation of the learning paths that were already present in the bachelor. Furthermore, by quantifying the results, sub-competencies were identified that need more attention. Mainly sub-competencies from *analytical thinking* and *critical thinking* were identified to need more attention.

Parallel to this study, the WUR defined 16 skills which need to be implemented in all bachelor programmes to stimulate students to develop skills throughout their studies (WUR 2017). The presence of these skills has been mapped, in a similar way as the curriculum mapping described above, and resulted in a list of skills that need more attention in the programme: *researching*, *data science*, *collaboration*, *feedback*, and *diversity & inclusivity*.

1.3 Aim of this paper

The aim of this paper is to provide an example how competencies can be integrated in an existing programme. In this paper, the integration of competencies in the current courses of the bachelor programme Food Technology at WUR will be used as example. First, it is explained how learning paths were designed in collaboration with teachers, to ensure the integration of competencies in the bachelor programme. Next, activities to stimulate the development of competencies, including reflection assignments, will be described.

2 METHODOLOGY

2.1 Process of integrating competencies and designing learning paths

To ensure sufficient competency development, students should have enough opportunities to practice competencies, while also receiving instruction, receiving feedback and being assessed. The integration of these aspects in the bachelor Food Technology was discussed with students and teachers. They both preferred competency development solely in existing courses, instead of designating a course for competency development. Therefore, it was decided to integrate competencies in existing courses, through implementing learning paths and moments for reflection. The main author of this paper was acquainted with all courses of the bachelor because of the curriculum mapping step, in which the presence and current position of competencies was discussed with course coordinators. While discussing, many course coordinators reflected on their courses and identified opportunities for improvement. These opportunities have been taken into account while designing a first draft of the learning paths. In these drafts, it was ensured that each learning path included sufficient opportunities for practicing, instruction, feedback, and assessment, through including both existing and new activities. The draft of each learning path was discussed with the involved course coordinators, to align and leading to a final learning path.

2.2 Implementation of reflection moments and explicit skills meetings

In addition to practicing, instruction, feedback, and assessment, students should also have the opportunity to reflect on their competency development (Wijngaards-de Meij and Merx 2018). To give explicit attention to competencies and opportunities for reflection, new activities were designed and taught during so called ‘Food Technology Skills Academy’ meetings. Although the term ‘competency’ is used in this paper, the term ‘skill’ was used in the communication to students and teachers since this term is adopted by the university. Therefore, the name ‘Food Technology Skills Academy’ was chosen. These meetings were organised around one or two competencies, in which students discuss experiences related to course activities and exchange ideas with peers. At the end of these meetings, students were asked to reflect on their experiences and competency development and to set goals. A general template for these type of reflection assignments was developed for all courses, which consists of three exercises:

1. **Defining a take-home message**: writing down insights they acquired while discussing and reflecting with other students on:
   - what challenges they encountered;
   - what went well.

2. **Reflecting**: reflecting on sub-competencies using a single-point rubric, which enables effective student self-assessment (Fluckiger 2010). In this rubric, students indicated per subskill what they are already good at and how they can improve (Figure 1):

I am already good at the following aspects:	**Subskill**	*I can improve myself on the following aspects:*
	I was able to structure meetings and to divide the work.	
	I was able to share all information with each other and integrate this well.	
	I was able to listen to others and speak up for myself.	

Fig. 1. Example of a single-point rubric that students complete to reflect on collaboration skills

3. **Setting a goal**: selecting one subskill, for which they formulated a goal on which they can focus on in a next course.

To ensure that students have an overview of their competency development throughout the whole bachelor, it was decided to work with a portfolio system. This portfolio is linked to the online learning environment of all courses and remains accessible throughout the whole bachelor. After finishing the reflection assignments as described above, students are asked to upload this assignment into their portfolio and insert the goal. In all courses, students can look back at their reflections and goals and are able to monitor their competency development throughout their study programme. Students are responsible and in charge for their own portfolio. Teachers can only review student's portfolio when students give access.

2.3 Evaluation of the reflection assignment and portfolio

The reflection assignments and portfolio were evaluated in the first course where they were introduced, through a survey, which was handed out after the exam of the course. In this survey, students were asked to respond to statements about the general impression of the assignments, the reflection activities and goal setting, and the general approach of skills development. A 5-point Likert scale was used, ranging from strongly disagree (1) – somewhat disagree (2) – neither agree nor disagree (3) – somewhat agree (4) – strongly agree (5).

3. RESULTS

As described above, several skills and competencies were defined which need more attention in the bachelor programme Food Technology, based on the research on competencies from (Van Berkum et al. 2024b) and the list of skills that the WUR defined. While all identified competencies as described above are being integrated in the programme, in this section we use the competencies *researching*, *collaboration*, and *diversity & inclusivity* to provide two examples how competencies were integrated. First, the process of designing and visualising the learning path of the competency *researching* is described. In addition, an example of the Food Technology Skills Academy activity related to *researching* will be given. Second, an example is provided how the reflection assignments of the competencies *collaboration* and *diversity & inclusivity* were included in the first course of the bachelor, together with the results of its evaluation.

3.1 Example of integrating the competency *researching* through a learning path and interactive activity

In order to develop the learning path *researching*, sub-competencies of *researching* that students should developed were defined through combining subskills as described by the university and sub-competencies from the research from (Van Berkum et al. 2024a). To limit the amount of sub-competencies, it was decided to integrate several sub-competencies and subskills, while excluding aspects such as searching for literature and data analysis, since these are included in other learning paths. This resulted in the following four sub-competencies:

- Positioning research (context, knowledge gap, research question/aim and hypothesis)
- Designing research (e.g. study, experiments)
- Performing research (e.g. performing protocols in the laboratory)
- Critically analysing and evaluating the research

These sub-competencies were included in a rubric, to envision what students should have developed before finishing their study programme.

Then, a learning path for *researching* was designed through first identifying the existing activities related to *researching* and making them more explicit. Next, new activities were added in the learning path. All sub-competencies in this learning path were planned to be addressed explicitly at least 2 times, with at least one opportunity for receiving feedback and assessment.

The draft of this learning path was discussed with teachers. Based on the discussion and feedback, the learning path was finalised. The implementation of this learning path made a strong improvement of the alignment throughout courses. Next, the learning path was visualised in the online learning environment in an interactive way, so students could see in which courses the competency is explicitly addressed and which activities are included (Fig. 2).

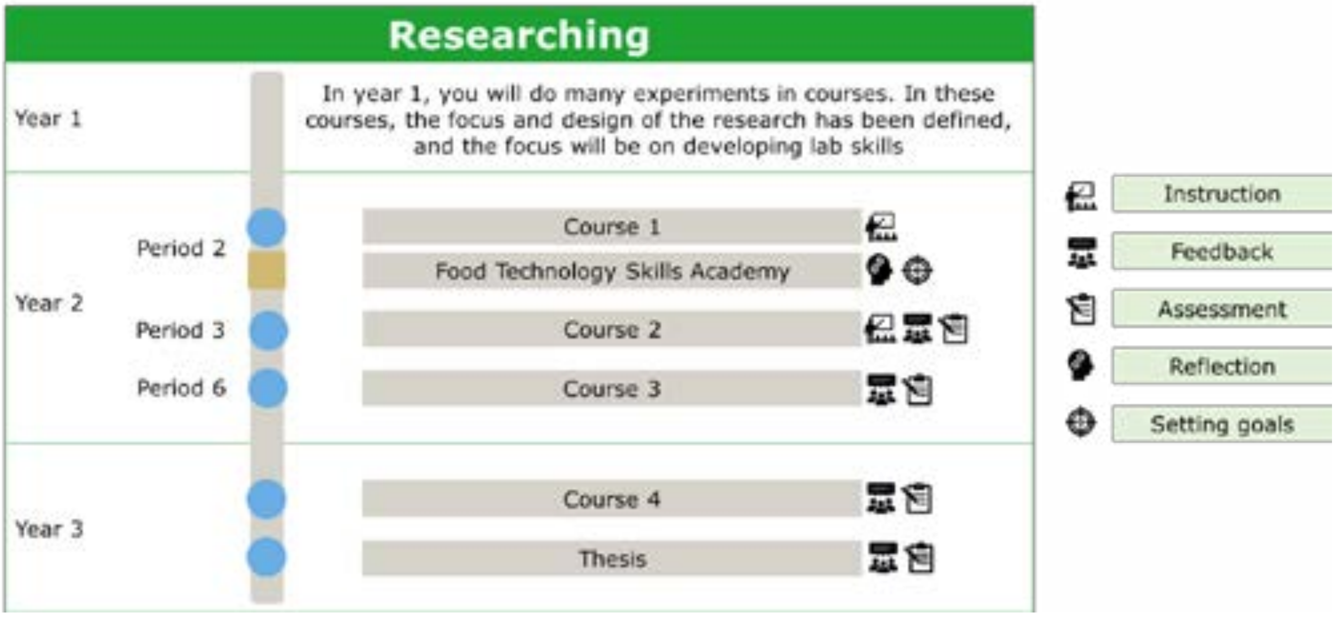

Fig. 2. Visualisation of the learning path 'researching'

To ensure that students are actively and explicitly discussing and reflecting on the competency, a compulsory Food Technology Skills Academy meeting was developed in course 1 (Fig. 2) of the learning path, which takes place in the second year of the bachelor. In this course, students designed an experimental set-up and performed experiments, and therefore focused on the subskills '*designing research*' and '*performing research*'. During the Food Technology Skills Academy meeting, students were asked to discuss and exchange their experiences related to these sub-competencies, with the following activities:

1. Discuss experiences regarding certain practical skills, such as making solutions, pipetting or using the centrifuge. Students were stimulated to discuss what they found challenging and to exchange tips with each other.

2. Identify experimental design techniques, such as blanks and duplicates. Students read lab protocols to identify the necessity of these techniques, in order to understand why they are applying certain techniques.

After the discussions, students were asked to write down interesting insights they gained. At the end of the meeting, students completed the reflection assignments as described in the methodology section. They uploaded this in their portfolio and set a goal for the next course.

3.2 Example of integrating the competencies *diversity and inclusivity* and *collaborating* and the evaluation of the reflection assignments and portfolio

At the start of the first year, students were introduced to the different disciplines within food technology. In this introduction course, also time is allocated to introduce students to the university and skills they should develop at the university, such as *personal development*, *collaboration*, *presenting, information literacy* and *diversity and inclusivity*. It was decided to start with portfolio assignments as described above on the two skills *collaboration* and *diversity & inclusivity*.

Diversity & inclusivity was selected since the bachelor Food Technology at WUR is an international programme, with students from many different backgrounds. Therefore, an interactive lecture about cultural differences was given, in which diversity and cultures in relation to collaboration were discussed. In the end, students were asked to reflect on what they learned in this lecture.

Collaboration was selected since students worked together on a case, in which they integrated all the discussed disciplines (e.g. food engineering, food chemistry). In the reflection assignment, students were asked to reflect on their collaboration skills in this course.

The use of the reflection assignments was evaluated via a survey. Results of this survey are shown in Table 1. In general, the assignments were found to be clear and students found it useful to reflect on skills. Overall, students did not find it difficult to reflect and set goals.

Table 1. Survey results on how students appreciate the reflection assignments for two different skills. Students (n=121) answered the statements on a 5-point Likert scale, ranging from strongly disagree (1) to strongly agree (5)

	Intercultural communication		Collaboration	
	Mean	SD	Mean	SD
The assignment was clear for me.	4.06	0.61	4.00	0.76
The assignment was useful.	3.49	0.90	3.41	0.92
I enjoyed working on this assignment.	3.23	0.93	3.08	0.96
I found it difficult to reflect on this skill	2.58	0.98	2.50	1.03
I found it difficult to set a useful goal on this skill.	2.90	1.07	2.75	1.08
I think it is useful to reflect on this skill.	3.84	0.87	3.83	0.82

The general way of skills development, and feedback on reflections and goal-setting has been evaluated as well (Table 2). It shows that students see the relevance and usefulness of reflecting and working on skills development. When they would like to receive feedback or discuss it, they slightly prefer to do this with teachers or study advisors, instead of with peers.

Table 2. Survey results on skills development and receiving feedback on reflection and/or goals. Students (n=121) answered the statements on a 5-point Likert scale, ranging from strongly disagree (1) to strongly agree (5)

	Mean	SD
I think it is relevant to work on skills development as part of my study.	4.13	0.70
I would like to receive feedback and/or discuss my reflections and goals with a teacher or study advisor.	3.38	1.12
I would like to receive feedback and/or discuss my reflections and goals with other students.	3.11	1.04
It was clear for me how I needed to work with the portfolio tool.	3.45	1.08

4. Discussion

To integrate competencies in the curriculum, learning paths were developed in consultation with course coordinators. Furthermore, activities with reflection assignments were designed. Since the approach of designing a learning path and the reflection assignments were not tailored specifically for food technology, it shows potential to be used in other disciplines as well, However, after the integration of competencies in the first courses, some discussion remarks can be made.

Designing the learning paths together with teachers was effective. While discussing learning paths together with the involved teachers, they got acquainted with other courses as well. Together, they discussed the activities in their courses and discovered overlap or gaps, which led to adaptation and thus better alignment between courses, as was pointed out by Bath et al. (2004) as well.

Integrating competencies in existing courses appeared to be an effective approach to enable students to work on competency development. For example, when students reflected on their *researching* skills, they were able to reflect on the skills they had applied during practicals. Therefore, instead of only finishing experiments, students were stimulated to think critically about the way of executing the practical experiments. They stored their reflections and learnings in their portfolio and were able to use this in a follow-up course, which is important for their learning trajectory (Van Merriënboer and Kirschner 2017). Although students were actively discussing and working on the competency *researching*, the effectivity of the activity has not yet been evaluated: an evaluation is planned at the end of the learning path.

Students need sufficient time for competency development. Therefore, the effectiveness of the reflection assignments and portfolio cannot be evaluated after one course. However, the assignments and portfolio appeared to be useful, based on the first results of the survey. Students did not strongly desire to receive feedback from teachers, study advisors or peers. This might be explained by the fact that students prefer to be in charge of their own skills development and portfolio. Since students know that their assignments are not being assessed, they are able to write reflections in their own language, without being scared about the feedback of teachers. However, the portfolio not being accessible for teachers can also be seen as a disadvantage of the system, since it is not possible to check if all students finished the assignments seriously. Therefore, it was decided to give students enough time to finish the assignments in class and allow them to leave after having completed it. However, it is not possible to find out if students need help or instruction with reflecting. Therefore, the effectiveness and monitoring of reflecting remains a challenge, which needs to be further studied.

ABSTRACT

The constant drive to improve engineering education's pedagogy stems from its crucial role in serving society. The practice of reading research articles is an academic strategy to keep up with the rapid advancement of the information and competencies required of today's engineers. Proficiency in this skill is difficult to attain, and unfortunately, this valuable capacity is often overlooked and not included in the curriculum for undergraduate students, which results in a loss of knowledge and a wasted opportunity. This article presents a practical case in an undergraduate Fluid Technology course, a teaching intervention designed for enhancing engineering students' skills in reading research articles carried out over a period of four months, within the boundaries of the course context. The first aim was to assess the progression of the students' ability to read research articles. The second aim was to elucidate student perceptions and conceptual cognition of their 'Capability', 'Ability', 'Skills' and 'Background' before and after the teaching practice. The teaching encompasses the reading assignments and post/out-of-class activities, the warm-up readings, two in-house ad-hoc lectures, the pre- and post-test readings and the pre- and post-questionnaires. The students' perception of self-improvement, as well as the positive shift in grades, are both reflected in the satisfactory results of the tests and questionnaires. This innovative educational research is readily adaptable to other cases and has potential for educating responsible engineers, thinking and understanding like engineers.

1 INTRODUCTION

Engineering education has always been fundamental to serving society and educating responsible engineers. To do this, it must be adaptable enough to adjust to the many different global forces that exist today and will exist in the future. Nonetheless, there are concerns about whether engineering practice will be able to keep up with the rapid advancement of the information, skills, abilities, competences, and attitudes that today's engineering demands (Lohmann 2008; Bubou et al. 2017). Engineering in higher education needs to adapt quickly in order to provide students with strong, astute, and perceptive engineering practice for the problems that lie ahead.

Reading scientific articles is one academic strategy used for improving engineering education: a transversal competency especially appropriate to be integrated in the context of a technical course. Students can greatly benefit from learning this ability in both their academic and professional careers. The relationship between a student's academic reading skills and success in education, even during the first year of an undergraduate course, proves it even more advantageous (Hermida 2009). The present work offers an effective method for reading scientific articles, developing analytical skills by questioning the content, and a scaffolded teaching strategy for not overloading students. A teaching intervention design for reading primary literature is given, based on a real case in practice in a compulsory undergraduate Fluid Technology course given by the Department of Fluid Mechanics at the School of Industrial, Aerospace, and Audiovisual Engineering of Terrassa (Spain), part of the Universitat Politècnica de Catalunya (UPC).

1.1 Primary literature on undergraduate education

An increasing amount of research has been carried out during the last 20 years, with an emphasis on how research experiences help students and how teaching and research are linked in higher education. Griffiths proposed ground-breaking methods that linked teaching with research (Griffiths 2004), and Healey's later work consolidated a comprehensive framework based on the research-based approach (Healey 2005).

Successful comprehension of primary literature is difficult since these are official documents that scientists use to communicate their research to each other. In light of mastering these techniques, students will be empowered to take responsibility for their own understanding, increasing excitement and motivation, which will lead to higher-quality learning results (Fernandez 2021, Yeong 2014). Research-based learning in engineering courses is particularly essential when it comes to motivation because most students do not learn through the study of primary scientific literature in high school science courses. Furthermore, via the production, relevance, and exploitation of digital resources, primary literature is influencing the social and cultural aspects of academic domains (Fry and Talja 2007). Nevertheless, there is no set criterion by which to judge a paper's significance or applicability at the time of publication.

Studies have been conducted on how teachers and researchers read primary literature and how they incorporate information from the articles into their professional knowledge, as research knowledge and primary literature serve as the foundation for the academic community (Bartels 2003). Other studies have focused on secondary sources and how teachers of scientific literature can use popular texts and popular genres (Parkinson and Adendorff 2004).

1.2 Research-based learning and engineering education

A strong grounding in many engineering techniques can be obtained through undergraduate research training. It has been demonstrated that it enhances students' comprehension and capacity to communicate primary scientific findings, giving them a competitive edge over their peers (Kozeracki et al. 2006). Discipline-based education research documents the most recent advances in the knowledge of how engineering and scientific students learn as well as how the syllabus is designed and teaching methods are employed (Benson et al. 2010; Singer and Smith 2013).

Curricula and teaching methods are evolving to guarantee innovative advances in engineering students' comprehension and learning. Therefore, in order to meet the problems of the twenty-first century, engineering education must strengthen the link between teaching and research. The method by which engineering educators conceptualise research and scholarship must be taken into consideration in order to effectively encourage and perform active learning and foster the development of the linkage between teaching and research (Brew 2003). It is essential that engineering educators take part in research-based programs, active learning, the overall teaching-research nexus, and employ current neuroscience knowledge as teaching methodology to enhance and make the lecture successful (Sanchez-Carracedo et al. 2021).

1.3 Course design using primary literature as an academic tool

Knowing how to read research articles is a skill that is often overlooked in university curricula. Most academics and research professionals have actually learned this skill through self-teaching (Greenhalgh 2014). As an additional component of their work, engineering educators study an extensive number of research publications. Unexpectedly, this talent is not taught frequently, especially not to undergraduate students, which results in an excessive amount of knowledge and effort wasted (Finelli and Froyd 2019).

The current initiative aims to provide methods for reading and useful frameworks for evaluating journal articles within the core of an engineering course while being guided and supervised by instructors. Conceptual comprehension is given priority over rote memorization in the assessment system in order to promote this kind of learning. Unlike traditional lecture-style training, which is teacher-centered, active learning involves all students participating in the learning process. It promotes an atmosphere that supports independent thought outside of traditional classroom settings and knowledge that is confident in oneself. Passivity and inaction are definitely not workable or feasible options. Integrating knowledge through problem-solving and case studies is one approach to accomplishing this, as opposed to just absorbing it. By doing that, it keeps pupils from becoming more demotivated and encourages a deeper comprehension of the topics at hand.

2 METHODOLOGY

2.1 Course context

Fluid technology is a compulsory course programmed each semester and encompasses two periods of six weeks each, with twelve sessions in total. The course typically has 70–80 students, between 21 and 24 years old, and all have to enrol in the subject. The students are proficient in both official languages, Spanish and Catalan. The textbooks and slides are written in Spanish, the lectures are taught in Catalan, and the assignments are in English. The course material, activities, and assignments were stored on the teaching support platform ATENEA (Moodle) on servers at the UPC.

The course is 4.5 ECTS, with 6 hours of teaching per two weeks, and its schedule is planned before each semester, sent to students one week in advance, and explained in the introductory lecture of the first week. In total, the teaching intervention encompasses the following:

- **Lectures and applications**, a variety of learning activities and problem-solving exercises [100 minutes per week]
- **Practice seminars**, including learning computer activities. [110 minutes per two weeks]
- **Self-study**. Pre/out-of-class activities (slides, short textbook-style readings, course-related short online videos, problem statements and resolution [90 min/week]) and post/out-of-class activities (online computer-based multiple-choice individual quizzes [90 min/week]). The total time scheduled represents 66% of self-study hours.

2.2 Intervention design and teaching practice

The teaching practice brings new perspectives to the engineering undergraduate course. The instructor, at the beginning of the intervention, informs the students and outlines the course regarding all programmed pre-, post-, and in- and out-of-class activities.

1. **The lectures on Reading Primary Literature** (RPL). The teaching practice is supported by two lectures to address how to identify the ‘anatomy’ of the paper, research questions and hypotheses, research argumentation, contents, and results in research articles.
2. **The reading assignments and the post/out-of-class activities**. Figure 1 shows the intervention program. The two lectures, RPL (1/2) and RPL (2/2) of 50 minutes each, are conveniently scheduled in the timeline with the reading assignments as post/out-of-class activities.
3. **The warm-up readings**. The designed progressive approach for a successful implementation of the intervention based on warm-up readings is depicted in Figure 1: 1st, 3rd and 4th, parts one and two. These warm-up readings accompany the students without overloading them, matching syllabus-related concepts and avoiding discouraging them during the intervention, especially at the beginning and before the RPL lectures.
4. **The test readings and the pre- and post-test**. The first aim of the intervention is to assess the student’s ability to read research articles; in fact, to measure the progression of this ability. Two test readings are planned to measure the effectiveness of the teaching practice: pre-test reading, 2nd, and post-test reading, 5th, Figure 1. The two articles were selected with attention, as different contents and syllabus-related concepts were used to generate the pre- and post-test questions.
5. **The pre- and post-questionnaires and SEEQ survey**. The second aim of the intervention is to elucidate student perceptions and conceptual cognition of their ‘Capability’, ‘Ability’, ‘Skills’ and ‘Background’ to read and critique primary literature before (pre-questionnaire) and after (post-questionnaire) the teaching practice (see Figure 1). Finally, the Student Evaluation of Educational Quality (SEEQ) survey is carried out to obtain perceptions, not only of the RPL intervention, but of the entire course.

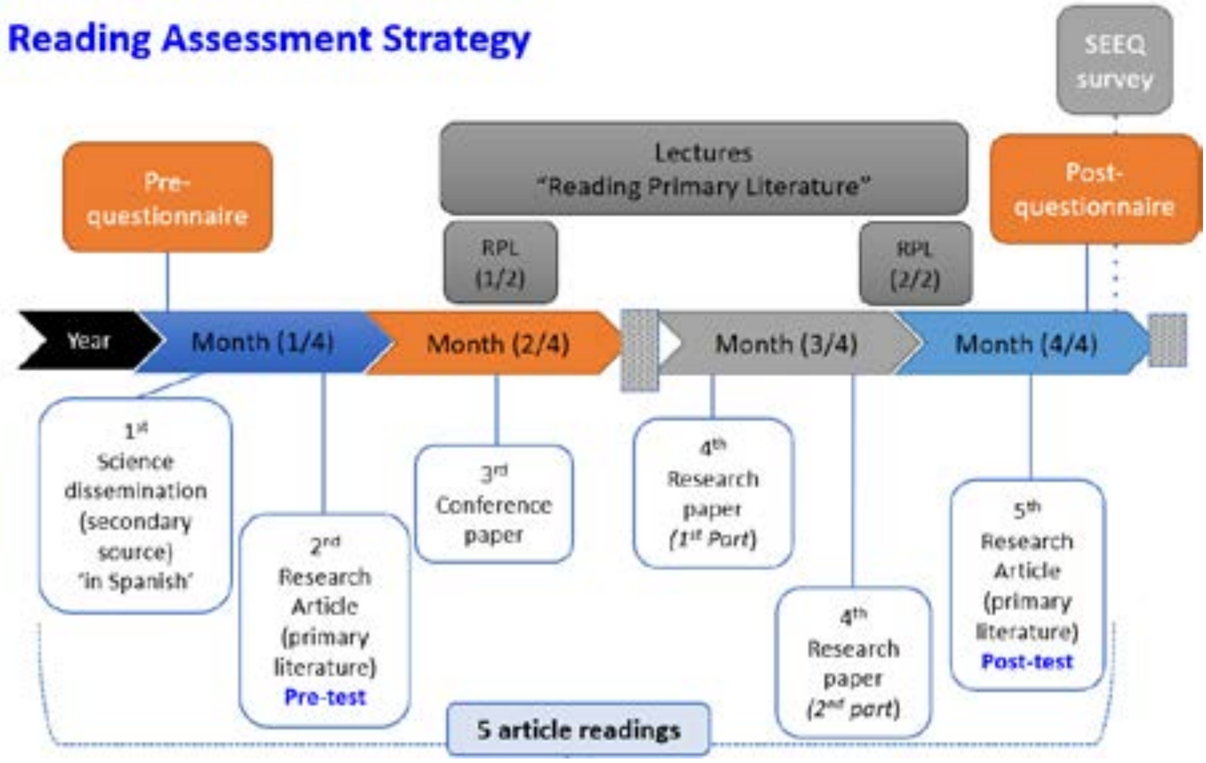

Fig. 1. The lectures on reading primary literature and reading assignments as post/out-class activities: the warm-up readings (1st, 3rd and 4th, part one and part two) and the test readings (pre-test 2nd and post-test 5th)

The intervention design presented is readily adaptable to other cases (f.i., subjects, classrooms, universities, etc.) to allow for rapid implementation in the learning environment. A more detailed explanation and context can be found in Gamez-Montero and Rodero-de-Lamo (Gamez-Montero and Rodero-de-Lamo 2023).

3 RESULTS

The data represent the 2023 fall semester student cohort, consisting of 72 students taking the pre- and post-tests (90% of the enrolment figure of 80 students).

3.1 Performance in the pre- and post- tests

The main objective of this intervention was to assess the ability of students to read research articles and their progression through a scheduled design, as shown in Figure 1. The test consisted of ten questions: five open-ended questions manually graded by the instructor's using a rubric and grouped as "Research Argumentation" (RA), as well as five computer-based multiple-choice questions grouped as "Contents and Results" (C&R). The students' grades in the pre-test were subtracted from the post-test grades, and the resulting distributions of the differences can be observed in Figure 2.

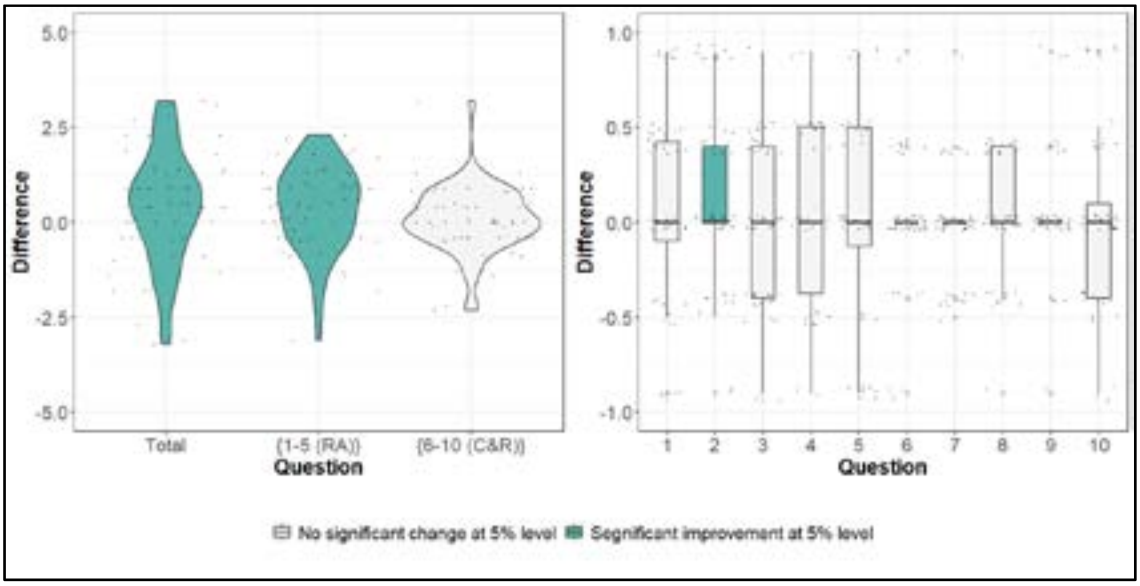

Fig. 2. Difference between the student post- and pre-test performance

The right section of the Figure 2 shows the distribution for individual questions, with adjusted box-plots. The left section of the figure shows the questions grouped by RA, C&R and Total, with violin-plots portraying the estimated density function of the data. The findings in this section imply that the students' ability to read primary literature did improve slightly during the intervention; however, it was only in the open-ended questions (RA), and these changes are mainly caused by the shift in question two. C&R questions are less related to reading skills than engineering concepts.

3.2 Students' responses in the pre- and post-questionnaires

The secondary aim of the intervention was the assessment of students' perceptions of their "Capability (A)", "Ability (B)", "Skills (C)", and "Background (D)" in reading the research articles by means of two scheduled questionnaires, before and after the intervention (see Figure 1). Figure 3 shows how the average score given by students' responses to each question changed over time.

It can be observed that overall, the students' self-judgment has improved. Most questions experienced a significant increase in response scores, but questions 2(A), 3(A), 7(A), 11(B), 12(B), 13(B), 16(C) and 17(C) did show a slight shift or were almost flat. These questions are related to the research question, materials, methods, and results of the article, along with the need to use a dictionary to translate English and a textbook to understand concepts. Hence, this slight significant change observed in these questions could be attributed to the fact that the articles were not given to the students in their native language, and the course did not last enough to get fully acquainted with the English terminology in fluid mechanics. The textbook question result is aligned with the C&R results. A paired test was performed to determine the significance of the results.

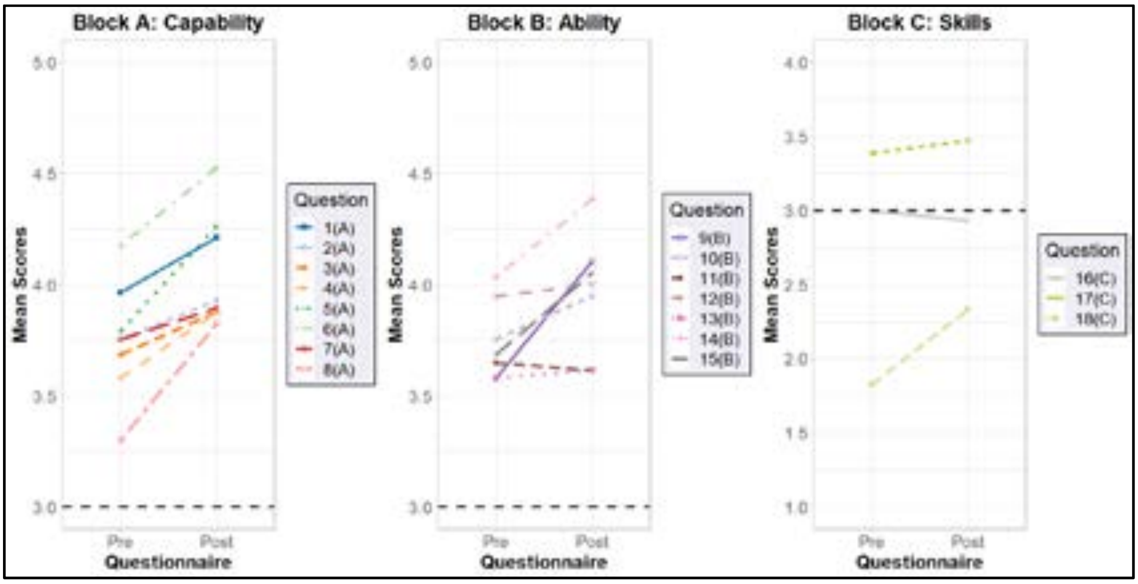

Fig. 3. Shift in students' average responses from pre- to post-questionnaire

Aside from the aforementioned cases, the improvements were shown to be significant at a 5% level using a Wilcoxon-signed test.

3.3 Conclusions

Through the four-month program, the students were given a set of tasks and lectures to enhance their engineering skills in reading research articles. The results of the tests, along with the questionnaires, showed that the strategy is satisfactory. This is both reflected by the students' perception of self-improvement as well as through the positive shift in grades, although it is worth noting to mention that the latter one was only observed in open-ended questions. This methodological approach still has room to grow, and as a future work based on the lessons learned, it will include citations as a factor in the selection of readings as a worthy bibliometric index to value the quality of the paper. In addition, a positive benefit will arise by providing a glossary with the main important words and descriptions in the articles to supplement them with additional information to aid readers in comprehending complex scientific concepts, since the vocabulary in research articles can differ drastically from the usual day-to-day English (Kararo and McCartney 2019).

4 SUMMARY AND ACKNOWLEDGEMENTS

The innovative educational research presented in this work has potential for educating responsible engineers; reading research articles makes it easier to embrace the challenging concepts of "roles of engineers" and "value of learning" that come with flourishing as engineer, and thinking and understanding as one. Students begin to take responsibility for their education, evolving into "self-directed learners" and aligning their strengths. Additionally, the findings may serve as a guide for engineering educators to improve the preparation of undergraduate students.

The authors gratefully acknowledge the Universitat Politècnica de Catalunya and its Galàxia Aprenentatge 2023 project for their invaluable support and funding. The authors also acknowledge the great aptitude of the students interested in improving the quality of engineering learning and teaching.

Conference Key Areas: *Teaching foundational disciplines of Mathematics and Physics in engineering education, Digital tools and AI in engineering education*
Keywords*: ChatGPT, critical thinking, evaluative judgement, AI-Tools, prompting*

ABSTRACT

The integration of Artificial Intelligence (AI) tools in educational settings presents both opportunities and challenges. This teaching innovation project presents a practical example of how generative AI-Tools (here ChatGPT) can be integrated into a Physics course in engineering education at the Zurich University of Applied Sciences (ZHAW) School of Engineering (SoE). Specifically, it first assesses how engineering students utilize generative AI-Tools in their daily work. Then, it explores how such a project can be used to improve the AI Literacy of the students, aiming to also boost students' critical thinking and evaluative judgement capabilities while using such tools. Students are asked to use and reflect upon ChatGPT in a lab session from the module "Physical Principles of Sensor Technology" in the third semester of the BSc Data Science program. The project is designed to encourage and guide students' use of AI technologies, promoting critical engagement in the context of their studies. It employs a mixed-methods approach to gather insights into students' perceptions and experiences with ChatGPT. The outcomes highlight a generally positive reception towards AI-Tools, being utilized for various academic tasks, including programming, data analysis, and general academic support. Challenges identified include the reliability and accuracy of AI-generated content, the development of effective prompts, and the need for guidance of critical evaluation of AI-provided information. The project's findings are summarised in a best practice guideline designed to support future students and to enhance the discourse on the use of AI tools at the School of Engineering.

1 INTRODUCTION

The current hype and emerging prominence of Large Language Models (LLMs), particularly ChatGPT, in educational settings mark an intriguing development in the pedagogical landscape. Discussions on the optimal integration of these AI-Tools in the curriculum are ongoing at almost all universities, including at the Zurich University of Applied Sciences (ZHAW), School of Engineering (SoE). One pressing concern observed at the SoE is the tendency of students to use ChatGPT without sufficient critical consideration of the tool’s capabilities and limitations. This surge in interest comes at a time when literature and empirical studies on the integration and impact of such technologies in education are notably scarce, making this an interesting area for a teaching innovation project.

This project was carried out as part of the Certificate of Advanced Studies (CAS) Higher Education 2023/2024 at the Zurich University of Teacher Education (PH Zürich) and completed in March 2024. It presents an example how generative AI-Tools (here ChatGPT) can be integrated into a Physics course in engineering education of the BSc Data Science program and how such a project can be used to improve the AI Literacy of the students. The paper is organized as follows: First, a theoretical background and a short literature review is provided. Then the methodology and practical implementation of this teaching innovation project are described and finally its results are presented.

2 THEORETICAL BACKGROUND

In this section the key concepts for this innovation project are defined with supporting references. The aim is not to provide a complete literature review but give some context for this teaching innovation project.

2.1 AI Literacy

AI Literacy refers here to the understanding and skills necessary to effectively use, interpret, and critically evaluate artificial intelligence (AI) and its applications. This includes knowledge of how AI systems are developed, how they work, their potential impact on society, and ethical considerations. The ability to critically use and evaluate AI-powered tools like ChatGPT is an essential part of AI literacy. A more detailed discussion can be found for example in (Long & Magerko, 2020)

2.2 Authentic Assessment

Authentic Assessment is an evaluation method that aims to assess learners' skills and competences in real-world or practical contexts. Unlike traditional forms of assessment such as standardized tests or multiple-choice questions, which often measure abstract knowledge, authentic assessment aims to assess the application of knowledge and skills in scenarios that resemble actual challenges and tasks in the real world. This type of assessment is recommended, for example, by (Sambell, 2019). It discusses the challenges in the assessment practice of higher education in the 21st century, in particular the need to develop assessment methods that better support learning. Likewise, in (Sokhanvar, 2021), it is argued that such assessment methods provide more relevant and engaging learning opportunities, preparing students for their future.

2.3 Critical thinking

Critical thinking refers to the ability to systematically analyse, evaluate, and interpret information to make logical inferences and informed decisions. One possible definition is: The "conscious, self-regulating formation of judgments that involves interpretation, analysis, evaluation, and inference" (Facione 1990). In the context of AI-Tools like ChatGPT, this means critically questioning the accuracy, reliability, and relevance of the information provided by the AI. Users should have the ability to recognize the limitations of AI, such as its reliance on training data, possible biases, and how their responses are generated.

2.4 Evaluative Judgement

Evaluative judgement refers to the ability to assess the quality of information or services and to decide to what extent they meet certain criteria or standards. One possible definition is: "the capability to make decisions about the quality of work of oneself and others', evaluative judgement highlights students' interactions with standards of performance and is aimed at 'future capacities and lifelong learning' (Tai et al. 2018). The importance of evaluative judgement in the context of holistic competence development is emphasised e.g. in (Luo et. al. 2023) and (Tai et al. 2023). In the context of AI, evaluative judgement includes assessing the appropriateness of AI-generated responses for specific contexts or purposes. It also includes understanding when and how AI-Tools can be used effectively, and when human intervention or review is required.

2.5 Comparison and contextualization

While critical thinking and evaluative judgment are closely related, the focus of critical thinking is on analysing and evaluating information to arrive at conclusions. Evaluative judgment, on the other hand, focuses more on assessing the suitability and quality of that information or performance against specific goals or standards. When using AI-Tools such as ChatGPT, users should be able to apply both: they should be able to critically analyse the information provided by the AI (critical thinking) and at the same time be able to assess how well that information or solutions are appropriate for their specific context or purpose (evaluative judgment). Developing these skills is a key aspect of AI literacy, enabling individuals to use AI technologies responsibly and effectively.

2.6 State of research

Research at the time of the project's implementation revealed relatively few papers on the subject. In (Murray and Ali, S 2023), a positive influence on critical thinking was generally found when using ChatGPT. In (Gimpel et al. 2023), the potential of these technologies to provide personalized learning experiences, support academic research, and enrich teaching through innovative teaching methods is discussed. The authors emphasize the need to use the possibilities of generative AI responsibly and to pay attention to challenges such as ethical concerns and ensuring data quality. In (Michel-Villarreal and Vilalta-Perdomo 2023), the authors discuss how ChatGPT and similar tools can revolutionize learning and teaching, for example by promoting the development of critical thinking skills and students' adaptability. At the same time, they point to the need to address the ethical, legal and pedagogical implications in order to enable an integration of these technologies that is both effective and responsible.

3 METHODOLOGY AND IMPLEMENTATION

3.1 Methodology

A combined qualitative and quantitative research approach (mixed-methods) was used.

- **Qualitative Interviews**: Qualitative interviews were conducted with selected students to gain deeper insights into their experiences, perceptions, and opinions on the use of ChatGPT and their development in the field of critical thinking and evaluative judgment.
- **Quantitative Survey:** An Online Survey (Microsoft Forms) was created to collect the opinion of a larger group of students and obtain quantifiable data on the effectiveness of AI-Tools as a learning resource.
- **Criteria Development and Best Practices:** In small working groups, students were asked to develop specific criteria and recommendations for the use of ChatGPT.

3.2 Project Implementation

The project was carried out as part of a mandatory lab assignment of the module "Physical Principles of Sensor Technology" in the third semester of the BSc Data Science program in December 2023. This BSc program under has not formally integrated considerations on how AI impacts the curriculum yet. There are no specific measures or adaptations addressing the problems or potential of AI within the program. The only guidance provided details how students should declare the use of AI in their bachelor theses. This was another motivation to practice the use of ChatGPT within this project. The project included a voluntary online survey about the general usage of AI-tools and a mandatory lab assignment with ChatGPT. The lab assignment included aspects of an "Authentic Assessment", in which practical tasks are asked to demonstrate the application of knowledge and skills. Specifically, an electrical circuit should be constructed, followed by performing several measurements and explaining the corresponding theoretical concepts. The resulting data should then be analysed and compared with theoretical predictions. Student groups were asked to use and reflect upon ChatGPT (free version 3.5) in this lab session and summarise their findings in a graded report, which accounts for 20% of the assessments. In addition, they had to answer the following questions in the reports:

1.) Describe in max. 5 sentences how ChatGPT works and what problems can occur when using it.
2.) Use ChatGPT in your research about capacitive sensors and as writing support for your report.
3.) Define 5 criteria to evaluate the answers from ChatGPT.
4.) Try to trick ChatGPT into giving false answers.
5.) Based on your own experience and 1.) - 4.), develop at least 5 tips that will help to use ChatGPT efficiently and to identify false information.

The analysis of the results was completed in March 2024.

4 RESULTS

4.1 Evaluation of the online survey

The voluntary survey, conducted in December 2023 included 35 students to gather insights on their experiences, opinions, or use of generative AI-Tools. Among this cohort, 27 individuals participated, yielding a response rate of approximately 77%. This substantial participation rate indicates a strong interest of the invited students in the topic. The survey results indicate that all participants utilize generative AI-Tools as part of their engineering studies with 56% employing them daily and 44% at least once per week. One surprising outcome was that all students had a subscription to the paid ChatGPT version 4.0 (costing approximately 20 CHF/month), highlighting the increasing integration and appreciation of AI technologies in engineering education.

Analysis of the responses concerning AI tool utilization revealed the following top five uses (see Fig. 1): Programming (89%), general writing support (81%), brainstorming (60%), data analysis (44%), and report creation and structuring (44%). Additionally, students use generative AI-Tools for research, translation, and solving Moodle quizzes, frequently encountered in SoE assessments. Participants also discussed the challenges and risks associated with AI tool use. A common concern was the overreliance on AI-generated responses. Many students underlined the necessity of possessing a solid understanding of the subject matter to detect errors effectively.

Inquiries about the integration of AI-Tools into the School of Engineering and the effectiveness of this teaching innovation project were also made. A majority (63%) found this innovation project helpful. In the interviews students mostly appreciated the compelled engagement with ChatGPT's functionality and its limitations. Moreover, 81% advocated for a more guidance and active incorporation of generative AI-Tools into the SoE curriculum, for example as prompt engineering.

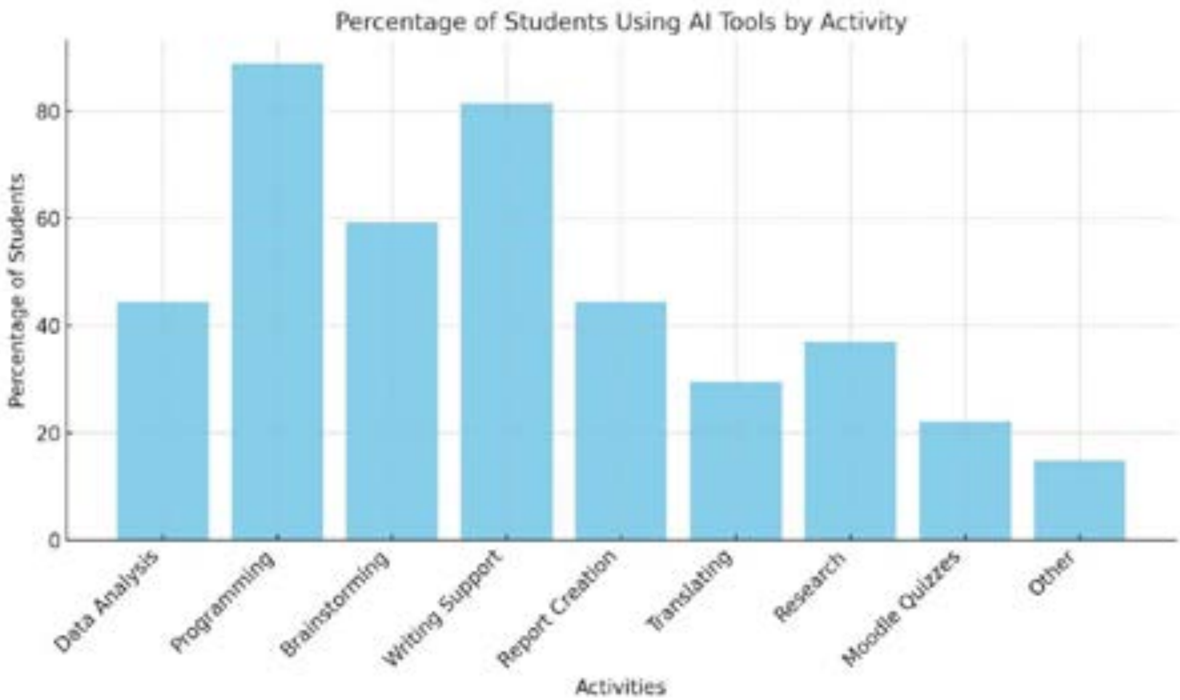

Fig. 1. Usage of generative AI-Tools.

4.2 Evaluation criteria for ChatGPT

The student groups defined 15 criteria to judge the quality of the answers of ChatGPT. Example criteria are listed below:

- **Relevance:** Answers are generally focused on the question asked but may deviate from the topic in case of ambiguous queries.
- **Reliability:** Can provide reliable information but should not be used as the sole source of critical decisions.
- **Timeliness:** Answers are based only on training data up to a specific point in time.
- **Neutrality:** Aims for objectivity but may have bias due to the training data.
- **Liability:** ChatGPT assumes no liability for the accuracy of the information provided.
- **Awareness of its limitations:** ChatGPT does not recognize its own limitations. It can sound convincing despite insufficient information.
- **Creativity and speculation:** Tends to give creative or speculative answers at times.

The students also pointed out that ChatGPT is not deterministic: it does not give the exact same answer to the same question, so citing ChatGPT or searching for plagiarism is not possible (see example in Fig. 2).

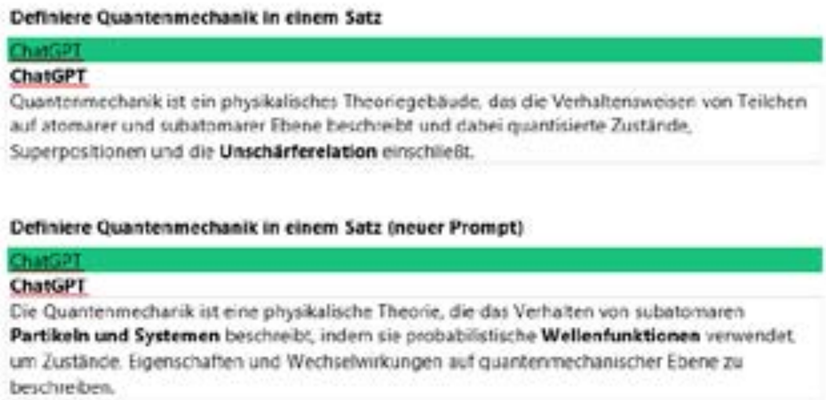

Fig. 2: Example that ChatGPT answers the same question (here how to define quantum mechanics) differently when asked in a new prompt.

4.3 Provoking False statements

The students tried to provoke ChatGPT to give false answers. The examples provided by the students can be roughly grouped in the following categories:

- Having multiple conditions, ChatGPT will often only take one or two of them into account when responding.
- After direct contradiction or false statements (see Fig. 3) incorrect answers and formulas are delivered.
- Sometimes ChatGPT admits to a misunderstanding, but then provides the same answer again.

- Errors in calculations with physical units.
- Multiple choice questions on complex physics topics often led to detailed but incorrect answers.
- When using leading questions or questions with intrinsic contradictions.

4.4 Recommendations for Best Practice Guideline

The students were very engaged in gathering tips and experiences on how to use ChatGPT efficiently. The student groups defined 25 recommendations. These results were summarised in the guideline, sorted into categories, and presented to the teaching department of the SoE as basis for further discussions. Example best practices are listed below:

- **Breaking down complex tasks:** Divide complex problems into manageable steps for effective processing.
- **Requesting a defined output:** Request a specific output such as a table or a Python dictionary (can be defined in the prompt).
- **Providing context: Fully** integrate the context into your question (e.g., by defining the role of ChatGPT) to avoid misunderstandings.
- **Using technical language:** Use precise language for high-quality responses.
- **Verification through multiple inquiries**: Vary the prompts to gain a broader understanding and test the consistency of the responses.
- **Verification through peer review:** Discuss responses with fellow students or lecturers to identify incorrect information.
- **Validation with another AI**: Compare responses with other generative AI models to determine the need for manual research.

ChatGPT Countries whose names start with the letter "V" are:

1. Vatican City
2. Venezuela
3. United Arab Emirates
4. United Kingdom
5. Vietnam
6. People's Republic of China
7. From Lands and Lordships
8. Pre-colonial conquests of Europeans in Africa

Please note that this is a list of countries whose names typically begin with "V." However, there are also some regions or areas with "V" at the beginning of their names, but they are not independent countries.

You There are no countries that start with V.

ChatGPT Sorry for the confusion. **You are right; there are no independent countries whose names start with the letter "V."** I apologize for the incorrect information in my previous response. Thank you for the correction.

Fig 3: Example of incorrect answer of ChatGPT after direct objection by the user with English translation. Note the original list also already contains errors.

5 SUMMARY AND ACKNOWLEDGEMENTS

This teaching project introduces an innovative approach to engineering education by explicitly incorporating ChatGPT into a traditional Physics course. During this project, students explored the advantages and limitations of ChatGPT- topics not yet integrated into the current curriculum but crucial for cultivating AI literacy. The task of inducing ChatGPT to generate incorrect answers particularly captivated the student's interest, in line with the project's aim to boost students' skills and critical interaction with ChatGPT. This goal was achieved, as demonstrated by mostly positive feedback gathered through the survey and the individual interviews.

The evaluation revealed that all data science students use AI-Tools at least once a week. The students have expressed a desire for more structured guidance in utilizing AI-Tools, recommending the incorporation of prompt engineering and programming assistance into designated modules of the SoE curriculum. A critical analysis of ChatGPT's responses, alongside comparison with other sources, improved students' lab reports compared to the previous year, both in content and linguistic quality. There theoretical background section contained less errors and the student used ChatGPT as companion to check their writing and explain key concepts. After the lab session the data science students exhibit a basic understanding of ChatGPT utilizing the tool with more considerable thoughtfulness. Engaging intensively with ChatGPT during the project thus not only elevates the efficiency of tool usage but also cultivates evaluative judgment and critical thinking abilities. However, proactive encouragement and support are necessary as students often engage with ChatGPT in a non-reflective and uncritical manner, often unaware of its limitations and lacking explicit guidance from their universities. Meanwhile, as the professional environment becomes increasingly AI-dominated, AI literacy becomes more and more vital.

By embedding ChatGPT within a traditional Physics course, this project diverges from traditional educational approaches, offering fresh insights into the value of generative AI tools and offering suggestions how they could be integrated into engineering education in a responsible way. In summary, the methods suggested in this project are:

- Establishing fundamental AI tool understanding.
- Integrating AI-Tools into authentic assessment settings to better prepare students for their future professional environment.
- Guided and critical utilization of ChatGPT in engineering education, including the exploration of incorrect answers and the development of evaluation criteria and best practices.
- Providing actionable guidance, ideally at an institutional or program level, to support students in effectively utilizing AI tools.

These suggestions offer practical inspiration and are adaptable to diverse educational settings within engineering education. The results indicate that students wish more guidance and integration of generative AI-Tools at the university level. Despite the limited statistics available in this project, the results clearly emphasise the importance of providing adequate support rather than leaving students to navigate AI-Tools largely on their own.

Acknowledgements to Prof. Dr. Mònica Feixas (PH Zürich) for supporting this project.

ABSTRACT

Critical thinking (CT) plays a crucial role in higher education. In the 12-credit master-level course Logistics Project at Linköping University in Sweden, students engage in practical logistical investigations with external clients. The projects are open-ended, something students find difficult and stressful. Teachers perceive the students do not really show a critical mindset to apply their knowledge to the specific context. To be able to support the students' learning better, student and teacher perceptions were gathered through questionnaires and interviews to investigate what, more specifically, is challenging for the students. The main challenges identified were: *Planning, The role of literature, Specify and delimit, Selection of investigation method*, and *Written communication of results*. These challenges all relate to CT. The measures taken to counteract the challenges were informed by literature as enablers to improve students' CT skills: a new visual model for investigation planning, new thematic seminars, and redesigned peer group meetings (PGM).

1 INTRODUCTION

Critical thinking (CT) plays a crucial role in academics, is a core component of higher education teaching and is important to most disciplines. The understanding and definition of the term CT varies between researchers, teachers, and academic disciplines (Ahern et al. 2012, Alsaleh 2020, Moore 2013). Although it lacks a uniform definition, it generally encompasses a range of mental processes and skills such as interpretation, analysis, evaluation, inference, explanation, and self-regulation (Alsaleh 2020) and the ability to ask adequate questions, evaluate, analyse, reflect, and draw conclusions (Hedin 2006).

The requirements for Swedish master-level engineering degrees include that students must demonstrate the ability to "critically, independently and creatively identify, formulate and handle complex issues", as well as "plan and with adequate methods carry out qualified tasks within given frameworks" (HigherEducationOrdinance 1993). Furthermore, at Linköping University (LiU) in Sweden, engineering education is conducted according to the CDIO framework (Crawley et. al., 2014), which defines several crucial engineering skills. Among these are Critical Thinking, (e.g., making assumptions, reviewing facts and information, and logical argumentation) and Systems Thinking (e.g., defining system boundaries, understanding wholes and subsystems, and making priorities and trade-offs) (CDIO 2022), sections 2.3 and 2.4. Hence, it is required that the students, with support from teachers, develop several advanced abilities linked to CT during their studies.

In the 12-credit course Logistics Project, part of the engineering curriculum at LiU, students in the final year of their master studies engage in practical investigations related to logistics. The course bridges theory and practice, preparing the students to tackle real-world logistics challenges with competence and professionalism. The learning objectives in the course address the most advanced levels of Bloom's taxonomy (Krathwohl 2002) and the SOLO taxonomy (Biggs, Tang, and Kennedy 2022). In the course, the students thus can develop and practice these skills that build the ability to think critically.

The students work in teams to plan and carry through logistics investigations, each team with their external organization as the client. To reach credible, transparent, and well-underpinned results, the students must apply rigorous and systematic procedures, using what we label “logistics investigation planning”. An important part of this is thorough planning before the action phase, where the plan is carried through. For example, research questions must be specified based on literature and information from the client, and methods for data collection and analysis are to be selected.

The course runs over one semester, with project planning in focus during the first half, and carrying through the project during the second. It contains several teaching and learning activities, the most central being lectures, videos, seminars, and supervision. The teams have academic supervisors as support. Each supervisor is responsible for 3-4 teams, who meet regularly in so-called “peer groups” (PG), where the supervisor also participates. The course design involves several occasions where students receive formative feedback, see e.g. Henderson et al. (2019), on interim reports from teachers as well as from peers.

Since this kind of complex, comprehensive open-ended project is new to the students, they find it difficult to understand and execute logistics investigation planning properly. From previous courses, they are not used to investing much time in planning before action, why they tend to rush through the planning too quickly. For the teachers, the objective is to enhance student learning and facilitate their academic progress. To be able to support the students better, the involved teachers would like to know more specifically what the students perceive to be the major difficulties. Therefore, this study set out to address the following two critical questions:

- What major difficulties do the students experience when learning logistics investigation planning?
- How can teaching and learning activities be designed to help the students overcome the difficulties?

2 METHODOLOGY

Perceived challenges were identified by a stepwise sequence. *First*, through individual and anonymous questionnaires, the 58 students following the 2022 course on 6 occasions during the course were asked to reply to reflective questions on what they have learned and how, and what difficulties and challenges they perceived. In total, this rendered 225 reflections. *Second*, in parallel to the student questionnaires, the 3 supervisors involved in the course reflected on the same things from a teacher's perspective, leaving in total of 15 reflections. *Third*, in the course evaluation questionnaire (used in every course at LiU) specific questions were added, and complementary feedback was given from 24 students. *Fourth*, the reflections were thematically analysed (Bell, Harley, and Bryman 2022) by 4 teachers (the course examiner, one of the supervisors, and two not actively involved in the course) to identify and cluster important challenges. *Fifth*, for verification and deepened understanding, the same teachers conducted 7 group interviews with in total 16 of the students. Since these students at the time of the interviews were in the final stages of their master’s thesis projects, they had applied the learnings from the course once again and were therefore able to give more mature reflections on the course. This gave a deeper understanding, as well as some new insights, and resulted in a compilation of selected challenges for further investigation.

Based on the identified challenges, some changes were implemented in the 2023 course. To capture whether these changes affected students’ perceptions of challenges, all 49 students answered a mid-course questionnaire, followed up with a meeting between the examiner and each of the 10 project teams. Moreover, a course evaluation questionnaire, like the one from 2022, was handed in by 39 of the students, and the supervisors’ opinions were caught by interviews. The project ended at the turn of the year 2023.The process described above is schematically shown in Figure 1.

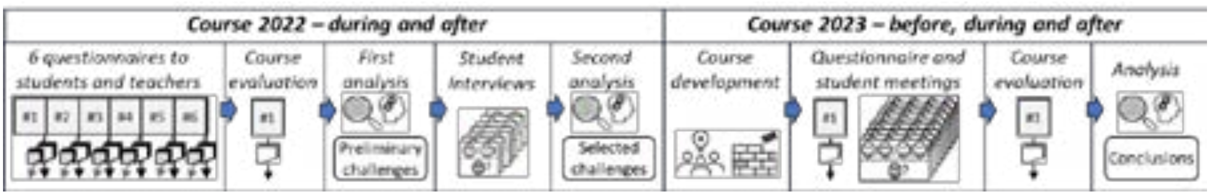

Fig. 1. Overview of the research process

3 IDENTIFIED CHALLENGES

In this section, the main challenges identified for students when learning investigation planning are presented.

Planning. As the tasks the students start with are open-ended and extensive, the planning of the project becomes central and more complex than they are used to. The students regard it hard to understand what activities to go through, make proper time planning, and divide the work within the team.

The role of literature. Relevant literature is used as support to form and specify the task, to analyse empirical data, to generate suggested solutions, and to analyse these solutions. According to the teachers, the students have a narrow view of the literature's role in the project, as well as how to search for relevant literature and how to write a useful frame of reference. The students agree and claim that they realise this too late, which leads to consequences in the form of re-writing, time delay, and less elaborated end results.

Specify and delimit. The initial, sometimes rather vague, task must be transformed into a clear one with relevant focus and reasonable scope. This requires the students not only to form research questions (RQ), set the system borders (i.e., define what to include in the study), and make delimitations, but also to give satisfactory motives for their decisions. Hence, they must make a lot of choices in areas where they don't feel competent. The fact that the team itself is responsible for formulating precise RQs based on literature and the client organisation, is by many perceived as a main challenge.

Selection of investigation method. Suitable methods for data collection and analysis are chosen by the students, something they regard difficult at an early stage of the project, i.e. in the planning phase. Especially, choosing methods for data analysis is perceived as abstract before data is collected.

Written communication of results. A general problem is the balance between transparency and trustworthiness (facilitated by thick descriptions) and readability (which rather is supported by less detailed reports). Specific problems pointed out by the students are how much of the empirical material to include, and how to combine empirical descriptions and analysis in a way that supports the reader.

4 CHANGES IN LEARNING ACTIVITIES

4.1 Measures taken as a response to the challenges

Table 1 shows the changes made in the 2023 course are related to the challenges described in the previous section. In addition to these, some other changes were made to reduce the scheduled hours to reduce the student workload and/or increase their flexibility. For example, lectures were to a higher degree pre-recorded, and peer group meetings (PGM) were shortened from 4 to 2 hours.

Table 1. Challenges identified and measures taken

Challenge	Measures taken
Planning	• Revised, more detailed, visual model for investigation planning, describing the steps/activities involved, from preliminary task to a detailed plan of *what* the investigation contains (RQs) and *how* it is to be performed (method description).

	• Teams are required to hand in time plans, by start-up for the planning phase, and mid-course for the action phase. • Increased number of PGMs to help students keep pace with the project. • Strengthened teacher instructions for PGM with a focus on overall planning.
The role of literature	• The importance of literature support is highlighted in the revised investigation model. • 2-hour seminar on literature, and its role for different parts of the investigation. • New PGM with a focus on literature search and frame of reference. Teacher instructions were created to support this.
Specify and delimit	• Course material (video, documents, presentation material) revised in sync with the revised investigation model. • Strengthened teacher instructions for PGM with a focus on the specification of tasks.
Selection of investigation methods	• Course material (video, documents, presentation material) revised in sync with the revised investigation model. • 2-hour seminar on how to form and present concrete investigation methods supported by literature. For example, thematic analysis is tested and discussed as a potentially useful method. • Strengthened teacher instructions for PGM with a focus on investigation methods.
Written communication of results	• 2-hour seminar with a focus on how to handle empirical material and analysis in the report. • New PGM with a focus on empirical material and analysis in the reports. Teacher instructions were created to support this.

4.2 Preliminary outcomes

Whether the measures taken have contributed to the students' ability to handle the challenges is not easy to tell. The aspects are not easy to measure, the number of students/teams is limited, and some of the learning effects may not be observed within the course, but rather in the succeeding master's thesis. However, by analysing student opinions from the course evaluation together with experiences from the participating teachers, we could see some preliminary outcomes.

The student response was overall positive, with small differences from the last few years on the graded questions. An exception from this refers to whether they regard the peer group meetings (PGM) to be supportive. The average grade rose from 3.3 – 3.9 (on a 5-grade Likert scale) in the last four years to 4.4 this year. Of the 25 students who chose to highlight one or several learning activities they especially appreciated, 19 (76%) mentioned the PGMs. Compared to previous years (30-40%) this is a significant increase. Examples of free-text comments from the students are: "*The PGMs gave opportunities for continuous feedback on our work"* and "*PGMs were good! Very good discussions and rewarding to see the work of other teams*" The teachers are also positive, and regard the shorter, but more frequent, PGMs help the teams to keep pace in their projects. With more checkpoints, the supervisors have more opportunities to discover if someone is lagging. Moreover, improved teacher instructions enabled more structured PGMs.

Three new seminars on specific topics were introduced this year, receiving average grades of 4.0 – 4.1. Free-text comments are predominantly positive: *"The seminars were very rewarding"*, but some also reveal room for improvement: *"The seminar content was not always in phase with what we did in the project"*. However, very few student comments appeared concerning specific seminars. As some aspects were already targeted at the seminars, the teachers felt the discussions at the PGMs could be held on a higher level than previously, which in turn affected the student reports.

In Table 2, preliminary outcomes are connected to the identified challenges.

Table 2. Preliminary outcomes of the measures taken

Challenge	Preliminary outcome
Planning	• PGMs and compulsory time plans helped students plan their projects better.
The role of literature	• Better student understanding of the different roles of literature during the project and in the report, thanks to the new seminar, new PGM, and revised investigation model.
Specify and delimit	• No observed improvements.
Selection of investigation methods	• Good discussions at the method seminar indicating an increased awareness among the students. • Slight improvement was observed in the reports concerning concrete descriptions of methods used and motives for using these methods.
Written communication of results	• Better student awareness of how to deal with analysis and empirical material in their reports observed at PGMs after attending the seminar concerning this. • However, still room for improvement in the reports.

5 DISCUSSION AND CONCLUSIONS

As outlined in the introduction, critical thinking (CT) is a complex concept, covering several aspects, among them reflection, evaluation, and analysis (Alsaleh 2020; Hedin 2016), i.e., skills associated with the upper levels of cognitive taxonomies, such as Bloom's (Krathwohl 2002) and SOLO (Biggs, Tang, and Kennedy 2022). The assignments in the course are designed to require the students to show such skills, including sections 2.3 and 2.4 in the CDIO framework (CDIO 2022). All five main challenges identified in this study are related to CT. *Planning* requires the students to critically evaluate what is possible to do within the project frames, *literature* must be critically evaluated to fit into the project, *specifying the project* requires an understanding of the present situation and weighing different opinions against each other, *investigation methods* should be selected after careful and critical consideration, and *written communication* requires much reflection.

The measures taken in the course also have support in the literature as supportive for developing critical thinking: problem-based learning, as the course begin with problems rather than with the content (Pithers and Soden 2000), questioning techniques in the PGMs using the Socratic method (Yang, Newby, and Bill 2005), the seminars use discussion methods as we teachers lead the classroom discussion being role models through reasoning out loud and in how to ask critical but well-intentioned questions (Taylor 2002). All in all, the course is given with an integrated approach to teaching CT (Hatcher 2006). Further, as generative AI and language models offer possibilities for text generation, there is a risk that writing skills are being affected. In the course, we therefore highlight writing as one of the most important skills. Condon and Kelly-Riley(2004 p. 66) assert that 'writing acts as a vehicle for critical thinking, but writing is not itself critical thinking'.

Although the modifications of the course have not resulted in elimination of challenges, we have taken a step towards an increase in students' critical thinking abilities. We intend to further explore this phenomenon, and we are planning a study aimed at further examining the evolution of CT skills both during the course and after the master thesis projects in the next upcoming round of courses.

Since identification of learning challenges is difficult, Knight et al. (2014) suggest using multiple methods to increase the chance of finding the real challenges. Our approach, capturing both students' and teachers' voices by a combination of reflection documents, questionnaires and interviews, is in line with this. We therefore argue that the identified challenges for critical thinking are relevant. Although we have studied a specific context, we believe these challenges to be generic rather than context specific. We also believe the multiple method approach to identify CT challenges to be applicable in various settings. The measures taken to overcome the challenges can be used as inspiration, but with careful adaption to the specific context.

The findings reported here are connected to a specific project funding, which allowed us to explore a certain topic, critical thinking, rather deeply. However, the results and outcomes of the project are not solely derived from a single, isolated effort. Rather, they reflect our long-term, structured approach and systematic practices, firmly established within our department. The Logistics project course benefits from structural capital, allowing for teacher rotation and preventing overreliance on a small number of teachers. Our development work follows a continuous improvement model (outlines in Figure 2) akin to the Plan-Do-Study-Act (PDSA) cycle (Kolb 1984). For instance, in the Logistics project course, we assemble a teaching team comprising supervisors, director of studies and the examiner. Prior to the course commencement, the team convenes for a startup meeting, reviewing the previous year's course closure and discussing modifications for the upcoming round. Throughout the course, the team holds brief reconciliation meetings to assess student project progress and team dynamics. A midterm student evaluation provides valuable input for adjustments during the course. At the course's conclusion, students respond to a course evaluation survey. Finally, the teaching team conducts a comprehensive debriefing, open to all departmental teachers. This session involves analysing student feedback, identifying successful practices, and proposing changes for the following year. Agreed-upon improvements are implemented in preparation for the next course offering.

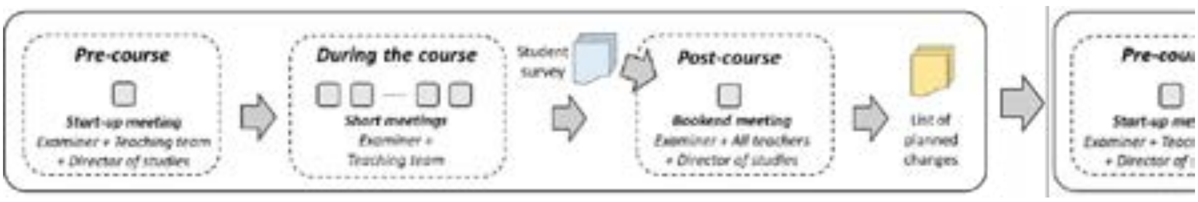

Fig. 2. Structured course development – an overview

Hence, the specific project made it possible to give extra focus on students' critical thinking, but the enhancements outlined in this paper would not have been possible without our systematic approach to education and didactic development. We strive to provide our students with structured ways of working. Likewise, we adhere to a structured methodology for course development, where students' as well as teachers' voices are heard and used. Using such a structured approach is something we strongly recommend as a key to identifying which aspects to focus in the continuous course development efforts.

ABSTRACT

The quality of communication in innovative teamwork is often a challenge both for students and for professionals and it can have a great effect on the work culture in the team. Often the teams are not able to solve the challenge in the team with the tools they have available. In this study, data has been collected from two innovative teams – a business case with an innovative team in a large global company and a case with a group of students taking a large innovation course at the university. Based on interviews with the teams members from the two cases different tools for communication have been developed and tested. The solutions consists of a list of recommendations and the presentation of three solution designs ”Gif-Fun”, ”Challenge Road” and ”Quest Canvas”.

1. INTRODUCTION

1.1 21st century skills & Interdisciplinary

The 21st century skillset is generally understood to encompass a range of competencies, including critical thinking, problem solving, creativity, meta-cognition, communication, digital and technological literacy, civic responsibility, and global awareness (for a review of frameworks, see Dede, 2010; Trilling, B. and Fadel, C. 2009). According to Dede (2010), the current workforce is not equipped to deal with the challenges of the 21st century and blames schools "classrooms today typically lack 21st century learning and teaching". Meaning students are expected to master the skillset during the beginning of their lives, if not, at the beginning of their professional lives.

To meet the need for 21st century skills, Expert in Teams (EiT), an interdisciplinary course at the Norwegian University of Science and Technology (NTNU), was developed (Veine et al.,2023; Sortland and Løje, 2019). NTNU's Experts in Teamwork course is compulsory in all master's programs and programs of professional study at NTNU and is offered to 2,500 students each year. About 100 members of the teaching staff are involved, and 200 learning assistants are employed each year (Sortland and Løje, 2019). EiT's method supports the learning of 21st century skills, in a facilitated active participatory setting. Meaning the teams learn as they go, supported by facilitators who are in turn supported and so on. The proverbial "village" (of help and support) is formed around each team member in what they literally call villages, where the teams have their bases (Veine et al., 2023).

In EiT students from different study programs are placed in interdisciplinary teams and the idea is that they will make use of different viewpoints and different competences to solve case problems for the involved companies.

1.2 Challenges with teamwork

The frustration from team members lacking 21st century skills can adversely affect productivity and well-being, leading to breakdowns in communication and hindering equal contributions from each team member (Oakley et al., 2004).

Tuckman (1965) presents a strategy model for team management, from team formation/building, conflict resolution and team performance. It can be difficult to know when to intervene in team dynamics and using Tuckman's model, it becomes clearer when a team needs support.

Expecting 21st century skills from the participants of teamwork, will invariably weigh differently on every individual, especially on the newer generations whom we already expect a lot, maybe too much, of today. A significant percentage of Millennials and Zoomers, the generation of most of the team members in the study, suffer from perfectionism and hold themselves to an incredible standard.

So while 21st century skills are desired, the reality is that people, in the described cases, were not equipped to handle anyone's, but their own needs. In the realm of innovative endeavors and within the collaborative framework of teams, the cultivation of constructive, open, empathetic, and reflective communication is a crucial factor (Veine et al., 2023). The challenges encountered in the collaborative sphere are not uncommon, with individuals grappling to establish themselves in teams, actively engage in the collective problem solving, while fostering a sense of inclusion. This study sought to explore the prospect of enhancing communication within innovation teams, unravelling the optimal timing and methodology for such improvements.

1.3 Wicked Problems

People are complicated, as individuals and in groups. Wicked problems mean that if a solution is implemented, it would immediately change how the participants experienced the developing conflict, and as such, mitigate the possible findings for further development. Thus, making iterations and development difficult.

The wickedness of the problem is also pressed upon by today's levels of feelings of inadequacy permeating the millennials and Gen Z's (Hjortkjær, C. (2024) who are described as lacking 21st century skills. Hjortkjær sees the decline in self-esteem, rise in feelings of inadequacy, accompanied by a perfectionist mindset, as the crisis of this generation.

1.4 Communication in teams

In this paper, we will investigate how the quality of communication in innovative teams affects work culture and conflict management. In the study, two distinct cases serve as important illustrations of the complexities surrounding communication in innovative teams. The first case delves into the dynamics of an innovative team of university students in a course at the university, the second a corporate innovation team in a global company with over 10.000 employees.

1.5 Conflict – how to handle conflict

Expect in Teams methodology demands facilitators observing the group dynamics over an extended period. The conflict is then facilitated, and the conversation is monitored, which means that someone has the power to tell you off if you're behaving out of line with constructive collaborative guidelines.

This is necessary if you want to teach people how to handle conflicts, because it forces them to deal with the conflict and their active role in it. As seen (preliminary observations, (Willemoës,, 2023) in the innovation teams, the only force maintaining the demand to deal with the situation was, for the students, a deadline for a delivery. But the innovation team didn't work like that, and deliveries were more personalised, meaning nobody had to adhere to constructive collaborative guidelines. When they didn't, it didn't negatively impact anything beyond the relationship of the people within the conflict, resulting in the rejected party becoming bitter and uncooperative.

The behavior described in the cases is not new to humanity or even impossible to understand, and in fact many theorists have come up with a litany of explanations and solutions. The behavior poses a problem because it is complex, multifaceted and not easily solved. Such is a problem described as "wicked problems" by Vermaas et al., (2020).

Initial observations highlighted the rapid formation of cliques within the groups, resulting in difficulty faced by individuals on the periphery with having their voices heard and opinions respected. This dynamic detrimentally impacted the overall workflow of the teams. Specifically, the lack of constructive conflict management, which is transducent to constructive teamwork, was noted "There is no constructive conflict management as seen in the theory of Tuckman, Brené Brown or EiT, in which open dialog, empathy and reflection are needed." (Willemoës, 2023)

So, the study posed the question "How can innovative teams optimise their ability to achieve flow in the face of conflict without neglecting each other's emotions, using gamification and the Expert in Teams methodology/approach?" Based on the findings, three design solutions were then developed and tested. When unable to add constructively to psychological safety within a team, the collaboration opportunities within the team diminishes.

2. METHODOLOGY

The university team was formed by pairs of students banding together and then finding a spot in a bigger formation of 6 people. The students had initially taken personality tests, but these hadn't been discussed or used in any meaningful way. The team was part of the course innovation pilot, which is a compulsory course for Bachelor of Engineering programmes af DTU.

The business team was formed, as most professional teams do, by employment, although a core group of team members had been employed a significantly longer time than the rest of the team.

The results were collected and analyzed as part of an exam project by Willemoës, 2023.

The empirical foundation of the study was established through 1:1 interview, observations of individuals and group dynamics, providing a comprehensive understanding of the communication, within the two innovation teams.

The interviews consisted of a total of 12 1:1 interview. 1 group interview with the university team, 1 group observation session with the business team and a spontaneous 1:1 interview within the business team.

The spontaneous 1:1 interview with the business team output was field notes. The planned sessions semi-structured interview guides had been prepared and voice recorded, with one exception being the group with the business team which was not recorded.

Semi-structured interviews formed the empirical foundation of the study, utilising Thematic Analysis formulated 3 overarching themes and 3 key problems. Solidifying the solution design with a combination of a problem tree and brainstorming.

The dataset then underwent a comprehensive Thematic Analysis, which led to the identification of eight different codes: Authority/Leadership, Personality Type, Maturity, Expectations, Psychological Safety, Conflict Management Skills, Motivation and Mood/Productivity. The eight codes crosswise formed three overarching themes: Personal Development, Project Execution and Power.

The scope was reduced to the Project Execution and, as much as possible, the Power theme.

Three key problems were identified: inner resistance towards interpersonal closeness, social exclusion or rejection of team members, and a discernible lack of workflow cohesion. The intricate relationship between these key problems and the essential 21st-century skills was unmistakable, with conflicting parties exhibiting a notable deficit in the skillset.

Theorists Brené Brown and Tuckman are, with EiT the underlying foundation of the solution design. With Brené Brown's shame research it is possible to take psychological safety into account when designing for people, using Tuckman's model for group development in teamwork a timeframe for the solution design is scoped for the forming and storming phase and lastly EiT's framework for facilitating innovative teamwork highlights what's currently lacking, corroboration wise, from the situations within the two teams.

In the last phase, Gamification was used to shape the 3 solution designs. The result was three concepts "Gif-fun", "Challenge Road" and "Quest Canvas".

3. RESULTS

The 3 solution designs are initial iterations of potential solutions, and will require iterative development, in collaboration with future struggling teams, to solve any of the observed problems.

Gif-fun is an icebreaker exercise to any team meeting, attempting to relax everyone towards the proverbial collaborative table. The goal of the exercise is to make the other team members laugh, resulting in a larger willingness to open up to each other. Gif-fun serves as preparation for the storming phase were the team needs psychological safety and willingness to be open in order to progress to the norming phase.

Challenge Road serves as a whistleblower system and an anonymous way to ask for help, within and outside of the team, with methods from conflict management.

The participant is guided through a binary questionnaire which ends with targeted advice for seeking help inside or outside the team and informing the participants of possible solutions. The goal is to empower the team members who are being ignored or disregarded, by empowering team members who do not feel psychologically safe, included or seen, in a safe and supportive and acknowledging social and racial bias. When the team enters the storming phase, support is needed to constructively enter the norming phase.

Quest Canvas (Figure 1) serves as a project management tool for enhancing team spirit, encourage praise, support, and transparency within the team.

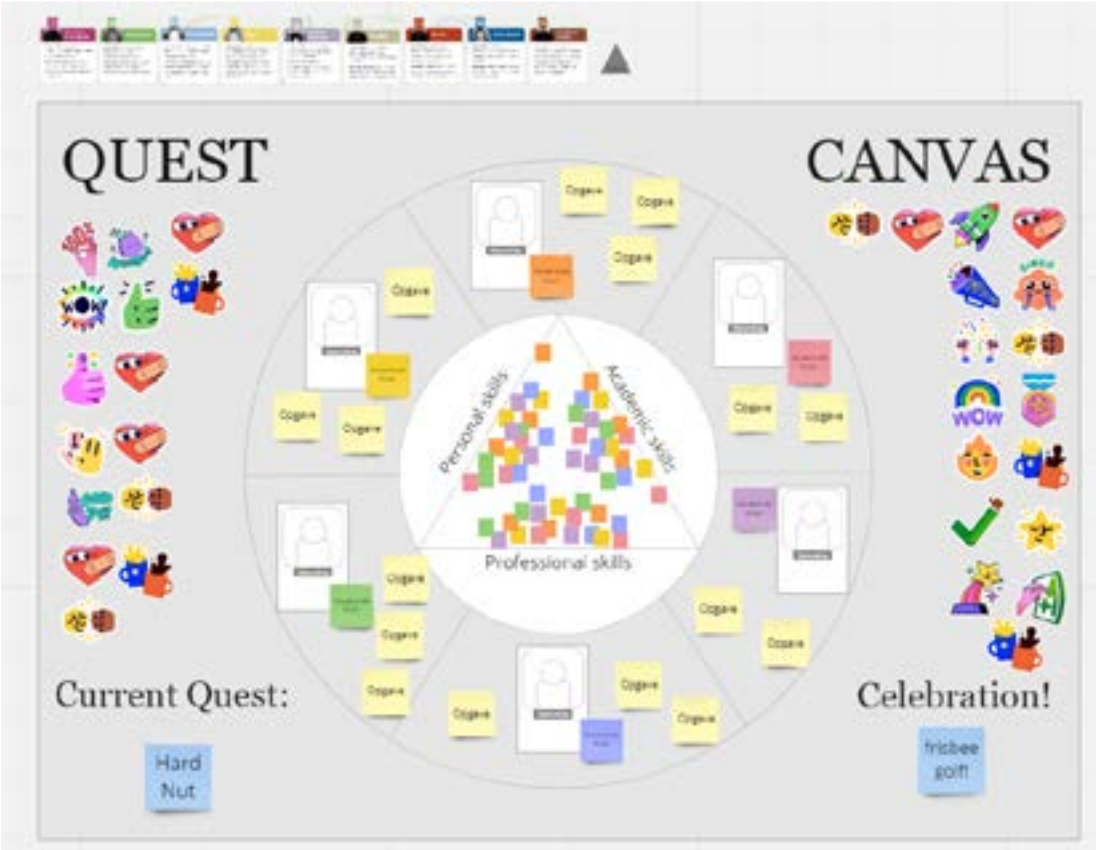

Figure 1: First iteration of Quest Canvas (Willemoës, 2023)

The Quest Canvas (Figure 1) proposed by the study (Willemoës,, 2023) provides an addition to the project management toolset. On the canvas is a circle with a space for each team member. The team member space holds a profile card, tasks and current role within the team. In the center of the team circle, is a “skills triangle” dividing every members skills into 3 categories “Personal”, “Academic” and “Professional”. On the left and right sides of the canvas are celebration stickers, the current focus of the project and how to celebrate the next important milestone within the team. The profile cards can be customized with personality tests and fun exercises (e.g. everyone draws themselves as superheroes)

All three designs are attempts at mitigating aspects of wicked problem theory, for the least invasive and subconscious solution as possible.

The solution designs were tested with another innovation team from the university. Feedback from Gif-fun was positive, though some unintentional consequences were identified such as too much “downtime” looking for gifs and unfunny gifs not landing with the team resulting in awkward silence. Quest Canvas was presented but would have to be tested for a time to form the basis for iteration. Feedback from Challenge Road were complicated to iterate on, the teams were so small that anonymity was practically impossible. Giving and receiving feedback in a group was difficult as the members weren’t trusting each other’s reactions to be constructive. One of the testers said she would withdraw socially and psychologically from a team “as much as she was forced to” in order to, function within the team, to deliver on time. The feedback further stresses that psychological safety is key in collaboration and complicated to achieve, without outside facilitation.

4. SUMMARY AND ACKNOWLEDGMENTS

The attempt to improve communication in innovative teams serves the purpose of facilitating innovation but does so by improving relationships within the team. The 3 solution designs attempt just that, within the confines of the situations described.

Psychological safety within the teams is key for constructive communication and sharing ideas, and everyone needs to approach the proverbial table for that to become possible. Thank you to the 3 teams who talked about their struggles and wishes in the hopes that it will get better when collaborating in high intensity teamwork.

The study is only based on two teams, but it shows that when subgroups form within a team, open and constructive communication suffers. Next step will be to iterate on the concepts, through more testing and interviews. Forming a framework for self-facilitation and collaboration.

The work presented is in the early stages. In future studies a broader testing of the tools in diverse educational settings could be required. Furthermore, collecting more feedback from uses in different contexts to further develop guidelines and to show how the tools meet diverse needs.

ABSTRACT

Facing global challenges, as formulated in the UN Sustainable Development Goals, requires engineering efforts. For this purpose, it is crucial to reflect on the role and responsibilities of engineers for society and environment. Here, engineering education's central contribution must be to educate competent engineering professionals. However, education often focuses on technical knowledge and competencies, instead of considering social or professional competencies as intertwined with the engineering profession. In this practice paper, a holistic teaching and learning approach is presented, aimed at fostering engineering students' reflection on competencies relevant for solving global challenges and on their engineering profession. By combining different teaching and learning methods in the context of active learning students are in the centre of the course and develop

teaching approaches for competency development in their education. Moreover, students not only analyze learning objectives of engineering study programs, but also develop own teaching approaches to address deficits in terms of competencies. Students' elaborations and feedback show that they acquired and strengthened especially self-reflection, critical thinking, problem solving, teamwork and communication skills.

1 INTRODUCTION

Engineering faculty and educators often differentiate between technical and non-technical competencies (Beagon and Bowe 2023; Jesiek et al. 2017; Trevelyan 2010a), which leads to students adopting this view and an education which often does not consider technical and non-technical competencies as "inextricably intertwined" (Trevelyan 2009, 1). Moreover, engineering graduates enter the workplace with misinterpretations and misunderstanding about engineering practice, as their educational preparation do not align with the expectations of their jobs (Korte et al. 2015). Although "social interactions lie at the core of engineering practice" (Trevelyan 2010b, 175), these aspects are often not considered as "real engineering" (Trevelyan 2010a). This narrow view is, correspondingly, often mirrored in students' motivation and acceptance in learning social or professional competencies (Brunhaver et al. 2018; Korte et al. 2015; Trevelyan 2010a).

This perspective of separating the social and technical seems downright contradictory, if we assume that engineers can and must contribute to solving global challenges, such as formulated in the UN Sustainable Development Goals. Such contributions require a holistic perspective and a reflection on social and global challenges. Engineering is crucial for the achievement of these goals, as engineering design, technologies and innovations are shaping the world (UNESCO 2021). In their report *Engineering for Sustainable Development*, UNESCO present several case studies, approaches and solutions to highlight the responsibility engineers have in contributing to sustainable development. One chapter in the report deals with engineering education for sustainable development, which is essential for the development and acquisition of competencies relevant to sustainable development (Beagon et al. 2022; Kolmos 2021). For this purpose, teaching and learning approaches are required that enable engineering students to develop corresponding competencies and to reflect on their role and responsibility as engineers to contribute to sustainable development.

The context for this practice paper is a master's course on "competencies in engineering sciences to solve global challenges" at a technical university in Germany. Taking into account the above-described reported tension between technical and "non-technical/social/other" competencies, this paper presents a holistic teaching and learning approach to sensitize engineering students to their professional identity. A special focus is set on engineers' responsibility to contribute to sustainable development. The inspiration for the course concept, which is presented in detail below, came from the paper *Engineering Students Need to Learn to Teach* by James Trevelyan (2010a). Stating that "engineering students themselves need to learn to be effective teachers in order to become effective engineers in practice”, Trevelyan argues that learning effective teaching skills requires social skills that are crucial for engineering practice.

In the following, the course design will be presented in terms of the teaching and learning approach, the intended learning outcomes and content as well as the examination task and assessment criteria. Furthermore, the course results will be presented and discussed.

2 COURSE DESIGN

“Competencies in engineering sciences to solve global challenges” is a recurring, elective 4 ECTS seminar at RWTH Aachen University in Germany. The seminar is aimed at master’s students from Environmental, Civil and Industrial Engineering. A previous version of the course is presented in (Winkens and Leicht-Scholten 2022a), the concept was then adapted in the winter term of 2022 and 2023. The first author of this study is the instructor of the course. Due to the course concept it is limited to a maximum of 20 students. The course is not only *about* the concept of competencies, but also *for* the development of competencies, which are holistically integrated in the whole course concept. This aims at students reflecting on their own competencies as engineers and placing them in a sustainability-related context.

2.1 Teaching and Learning Approach

Based on an active and constructivist learning approach, several teaching and learning methods and activities are applied and combined in the course to provide a student-centered and interactive learning environment. Table 1 presents an overview of these. The overall theme is *competencies,* which constitutes not only the content of the course, but is also mirrored in the methods used.

Table 1. Teaching and Learning Methods and Activities in the Course

Method/Activity	Description
Lectures	Research-led lectures are held by the instructor to give students an overview of current discourses on the topic of competencies in engineering (education). Within the lecture sessions, students collaboratively discuss current research topics and trends.
Research-based	The course has a research-based design. For this purpose, research questions are formulated by the instructor that students approach collaboratively as part of their exam. Furthermore, the students develop research skills, especially in qualitative research.
Collaborative Learning	Students work in small groups throughout the course. During the lecture sessions there are various smaller group discussions and for the examination coursework they work in groups. All group learning activities are structured and monitored by the instructor.
Think-Pair-Share	Think-pair-share provides both individual thinking and sharing ideas/perspectives (Felder and Brent 2009). A scientific paper is to be prepared for each session. Students are to prepare the paper independently (Think), discuss it with other people at the beginning of the following session (Pair) and afterwards present it to the plenary (Share).

(Peer) Feedback	Through continuous and reciprocal feedback, students reflect on their learning process and performance, as constructive feedback can improve student learning performance (Das 2023). Students give feedback to the other groups on their work, feedback to the teacher on the course concept, and anonymous peer feedback to their group members on their teamwork, commitment and performance. For the peer feedback, they receive instructions to constructively formulate criticism. Students also receive both oral and structured written feedback from the instructor on their work, i.e., the perspectives of all actors involved in the learning and teaching process are considered.
Reflective Writing	To foster (self-)reflection and critical thinking among students, reflective diaries are used. These were inspired by and adapted from Wallin et al. (2016); and Wallin and Adawi (2018). By answering weekly guiding questions, students reflect on their learning process and experience which also enables the instructor to understand them better. Moreover, the students can submit voluntary critical reflection papers that relate to self-selected topics from a session. This is also an opportunity to receive bonus points for the final grade. Students get feedback by the instructor for both reflection activities.
Self-Assessment	To not only reflect on their competencies and attitudes, but also to reflect on their learning process, students complete a survey before and after the course. The results are presented to the students and discussed with them.

These methods are presented transparently to the students, and it is explained to them why they are relevant and used in the course.

2.2 Learning Outcomes and Content

The course is constructively aligned with its content and assessment (Biggs and Tang 2011). In terms of intended learning outcomes, after completing the course students should be able to:

- **Assess** various competencies with regard to their relevance for social and sustainable technology design
- **Reflect** on the relevance of socially responsible and sustainable technology design for solving global challenges
- **Reflect** on the relevance of responsible and sustainable technology design in the context of their studies and for their later professional life
- **Evaluate** self-generated research results with regard to a research question based on a qualitative content analysis
- Independently **develop** ideas and problem-solving skills regarding an integration into a university teaching context

With regard to professional competencies, the course aims especially at fostering analytical, problem-identification and -solving, creative and critical thinking, teamwork and collaboration, communication, (self-)reflection and learning skills.

The individual lecture sessions are divided into the following themes:

- **Introduction**: What global challenges need to be overcome in the context of sustainable development? What role does education for sustainable development play in this? And why is it relevant for engineers?

- **Competencies and Engineering Education**: What does competency-based education mean? What challenges does this pose for engineering education? What discrepancies arise with regard to the acquisition of competencies?
- **Engineering Identity**: What factors define technical sciences/engineering? What role profiles can engineers have? Why do students decide to become engineers? What competencies characterize engineers?
- **Shaping Competency** („Gestaltungskompetenz“): Why are topics such as sustainability, ethics and responsibility relevant for engineers? Which competencies are relevant in the context of sustainable development? To what extent do engineers bear responsibility for lived and built environment?

These themes are presented and discussed in the individual sessions. Each topic is introduced through current research from the field of engineering education. This enables students to familiarize themselves with international discourses on the subject and at the same time to reflect on their own (previous) acquisition of competencies.

2.3 Examination

The examination is divided into three parts, two collaborative parts and one individual part. The collaborative parts are graded, the individual one is not, as it is about students' personal reflection.

Students work in groups of around five people to answer the following research questions: *Which competencies for solving global challenges are addressed in selected engineering degree programs? What are deficits in acquisition of competencies in the individual degree programs and in a university comparison? Which teaching and learning concepts are suitable for addressing these deficits?*

In the first collaborative part, students analyze the qualification/learning outcomes of selected engineering degree programs (M.Sc.) of European universities with regard to competencies for solving global challenges. In particular, the students are asked to work out *deficits*. The preliminary assumption that there *are* deficits in the learning outcomes of the degree programs was made, as the students analyze and evaluate the competencies more critically as a result. Moreover, based on previous research, it was already known that learning outcomes in engineering degree programs are formulated very heterogeneously (Winkens and Leicht-Scholten 2023). In order to delimit the scope appropriately, the task is restricted at various points: For the comparison, the students have to select two universities from the European IDEA League (Chalmers University of Technology, Delft University of Technology, ETH Zurich, Polytechnic University of Milan, RWTH Aachen University), as it represents a strategic alliance between five leading European university of science and technology (see https://idealeague.org/). Furthermore, they must decide which of the respective degree programs are engineering programs. They also have to decide on a competency related to the course content to analyze. This decision has to be scientifically justified and motivated. Based on the examination documents provided by the universities, they then qualitatively analyze the qualification/learning outcomes formulated there for the individual degree programs and compare the results of the respective universities. They must consider the following key questions in their analysis: *How far are the chosen competencies relevant for engineers to solving global challenges? Are they actual competencies or a description of the program* *content? How are the competencies presented/formulated? To what extent are they included in the study programs? What differences arise between the individual study programs? Are there any differences/conspicuous features when comparing the two universities?*

In the second collaborative part, inspired by James Trevelyan (2010a) paper *Engineering Students Need to Learn to Teach*, the students develop a theoretical teaching and learning concept based on the deficits analyzed in the first part. The concept should relate to the duration of one semester, explicitly address engineering students and aim to improve engineering education. The students are free to decide on the specific target group (e.g., bachelor or master, individual disciplines or multidisciplinary), the course size and any content requirements. The application of constructive alignment is central, i.e., they must define learning outcomes, consider how these can be achieved, what content is necessary for this and how these can then be assessed. The task is not about specific time scheduling, but about a sound concept. The groups present their concept creatively and freely through a screencast aimed at convincing the other students in the course of the suitability of the teaching concept.

Students can arrange consultation hours with the instructor at any time. However, each group must arrange at least one consultation hour in the middle of the semester to ensure that their work on the assignment is going in the right direction. This mandatory consultation hour has proven to be effective in the past, as otherwise only those students who are already very motivated will request feedback on a voluntary basis (Winkens and Leicht-Scholten 2022b).

The students submit their work from both parts as part of a screencast lasting a maximum of 30 minutes. The videos of all groups are made available to all students. These are then critically discussed in a joint discussion session. For this purpose, the students were given questions to guide their feedback: *What do you like about the teaching concept and why? What are the strengths of the concept? What are weaknesses? For what reasons would you (not) choose the course yourself? To what extent is the concept suitable for addressing the respective competencies? To what extent has constructive alignment been taken into account? Do the teaching concept and target group align? What suggestions for improvement would you give to the other group? What possible extensions would you include in your own concept?* After this session, the students were asked to integrate the feedback in a final report, reflect on it and explain what they would have done differently in retrospect. This report serves as documentation of their group work and their work steps; it also contains a reflection on the group work (what worked well and what less and why?). This more detailed documentation aims to make it easier for the teacher to understand how the students have developed their task.

The assessment is mainly based on the quality of the content of the results (consideration of the key questions, scientific soundness, comprehensible analysis, stringent argumentation/evidence/reasoning). Further assessment criteria are the completeness and comprehensibility of the documentation of the procedure and the discussion and reflection of the results. The assessment criteria were presented and explained to the students at the beginning of the course.

The individual part includes the reflective diaries and the peer feedback, which are submitted individually by the students. For the peer feedback, the students complete a survey on all their group members, with items relating to communication, teamwork and commitment. They also give free feedback to each of them, which must be formulated respectfully and constructively. The students also have to assess themselves. An evaluation of the feedback and a comparison with the self-assessment is made available to the students individually.

3 RESULTS AND DISCUSSION

In the context of a scientific evaluation various methods and indicators are used and combined to measure the success of the course and to assess whether the intended learning outcomes have been achieved. This includes a standardized evaluation provided by the university, the pre-post survey on competency acquisition, the learning diaries, the students' elaborations and a final joint feedback session, in which the seminar concept is discussed with the students. In the following, we summarize and discuss the most important aspects of these feedback methods.

In general, the course was evaluated very positively in both semesters. Students especially highlighted the groupwork and the discussions in the sessions, the requirement to actively engage and the opportunities for (self-)reflection. Concerning the course contents, they especially valued the sessions on engineering identity and responsibility, as they led them to reflect on their role and responsibility as engineers by asking "the simple and banal question: 'Why am I an engineer?'", to cite one student. In some learning diaries, the students' previous insecurity on their sense of engineering identity became apparent, as one female student pointed out:

> The discussions encouraged me to think about what kind of engineer I want to be and where I see my role. I had previously given a lot of thought to the fact that I don't fit the stereotypical image of a female engineer, which made me feel like I hadn't chosen the right field of study for me. I took away from this course that it is ultimately up to me how I interpret engineering for myself and that has given me a lasting good feeling.

Moreover, they expressed surprise that the topic of "competencies in engineering (education)" is so present and relevant globally, while at the same time expressing a lack of understanding that it seems to be represented so little in their education.

At the same time, in the first iteration of the course in winter 2022, some students criticized the "vague topic" of the course:

> Even though it is an extremely important topic, it is not really 'hard facts' that are learnt.

Going along with the following statement:

> Unfortunately, no specialized knowledge was imparted. The focus was on acquiring non-technical competencies. These were taught well. I think my personal self-reflection in particular improved as a result of this seminar. The unit on engineering identity in particular made a lasting impression on me and led me to scrutinize my self-image again and see which skills in the area of 'being an engineer' I may still need to acquire in the future.

The student quoted here is completely right in his statement that no technical knowledge was taught, as this is not the aim of the seminar. However, the statement illustrates that the (perceived) lack of this technical knowledge is perceived as negative, which mirrors the often-reported discourse in engineering education literature about the (misleading) differentiation between “soft versus hard” skills (Berdanier 2022; Trevelyan 2010b) that is also adopted by the students. As a result, the topic on technical versus “other” competencies was proactively addressed in the following semester in 2023 and discussed with the students, starting with Berdanier’s (2022) statement on “A hard stop to the term ‘soft skills’”. In 2023, no comparable criticism was expressed by any student; on the contrary, the relevance for professional practice was emphasized several times, for example by one student:

> The course imparts knowledge that is not just theoretical but can be applied directly in the course and later in professional practice.

In terms of the acquired (or strengthened) competencies, students highlight self-reflection and critical thinking – both in terms of their engineering profession and in terms of their personal development –, teamwork, communication, problem solving and self-organization. The answers to the pre-post survey are similar in both semesters and show that students self-assess the development of their competencies positively, as, for all items, the competencies were ranked higher after than before the course. This applies not only to specialist knowledge about, e.g., sustainability or the concept of competencies, but also to social and personal competencies such as presentation skills, problem-solving, teamwork and conflict resolution.

The individual learning diaries illustrate the aspects of self-reflection in terms of competencies as well as the reflection on the personal role as engineers, as two students conclude:

> The most important thing for me was realizing what role I have as an engineer and to what extent the engineering skills I perceive as standard differ from the skills required to fulfil social responsibility. In professional life in particular, it is important to apply the skills I have learnt in order to prevent conflicts of responsibility. So that I can continue to have such experiences and develop further, I would ask myself more often in future what I make which decisions for in my job and would reflect on my training in a different way. The course helped me in particular with my self-reflection.

> The course has given me a different and more diverse awareness of my responsibility as an engineer. Regular civil engineering courses do not talk about the competencies of engineers and their responsibility towards society. However, it is very important to be aware of the social and ethical duties we have as engineers. In addition, critical self-reflection was encouraged by the topics covered in the course and I questioned myself and some of the decisions I made in my engineering degree program.

Students’ coursework was overwhelmingly positive. The groups each independently defined and analyzed different foci of competencies for solving global challenges, i.e., critical thinking, problem solving, interdisciplinary thinking/working, intercultural competency, teamwork and communication. In most cases, they scientifically substantiated and argued why they chose this focus and why it is relevant for engineers facing global challenges. The self-developed teaching and learning concepts were also very creative and addressed the competency deficits in their respective degree programs. In some cases, there were weaknesses with regard to the consistent implementation of constructive alignment, in other cases expectations were fulfilled as the students precisely formulate learning outcomes and constructively aligned their concept. As explained in Section 2.3, students' elaborations were reviewed and discussed in a joint session. It was noticeable how critically and profoundly the students dealt with each other. As a result, the majority of the strengths and weaknesses of the concepts that the instructor had identified were also addressed by the students. This demonstrates an in-depth examination and understanding of the topic.

However, in all feedback activities it became apparent that the groups had several challenges to deal with. Especially time management in the context of students' groupwork was frequently mentioned, where the obligatory consultation hour was considered to be helpful to structure work around the given time constraints. Moreover, students pointed out challenges in dealing with scientific literature and difficulties in the qualitative analysis of learning outcomes, where they sometimes tended to analyze quantitatively, as this seemed more intuitive to them. The formulation of constructive feedback to group members was cited as a further challenge. At the same time, however, they also saw this as very valuable, with the knowledge of receiving feedback from their peers being a relevant motivating factor for engaging in group work. Overall, it was found that the feedback was mostly constructive and appreciative.

4 CONCLUSION

This practice paper presented a holistic teaching and learning approach for dealing with and reflecting on competencies in engineering education. By combining different topics related to engineering for sustainable development and different teaching and learning methods in the context of active learning, students reflect on both their professional development as future engineering practitioners to become “real engineers” and on their personal development. The task of developing a theoretical teaching and learning concept has helped students not only to engage more intensively with competencies, but also to reflect on how they can teach them to others. We are aware that the purely theoretical conceptualization and presentation of an actual teaching experience is not sufficient, but this was not feasible for the students due to limited resources and workload. However, there are plans to integrate virtual reality into the concept so that students can then carry out their concepts in a virtual space. Furthermore, this paper focused on the presentation of the course concept and not on a well-founded qualitative or quantitative evaluation of the existing data. In-depth interviews with students may be a useful next step to assess their learning experience in more depth.

Students' elaborations and feedback have shown that they acquired and strengthened especially self-reflection, critical thinking, problem solving, teamwork and communication. Moreover, they highlighted the relevance of the topic of engineering identity for themselves, as the course has helped them to shape and to define it in the first place, but also to question and reflect on their engineering identity. Overall, the course concept has shown to be effective and successful, and underlines that “teaching to learn” is an effective educational approach to strengthen engineering students' acquisition and recognition of professional competencies.

Acknowledgements

Above all, we would like to thank the students who participated in the course and enriched and improved it with their perspective. We would also like to thank the students who allowed us to publish their thoughts here, and Felix Engelhardt for his input and ideas on the concept.

ABSTRACT

In this manuscript, we explore the integration of generative AI into notebook-based teaching in engineering bachelor education. We describe a prototypical educational framework where Jupyter Python notebooks form the core of all teaching and learning methodology. This eliminates traditional lectures and enables interactive, hands-on learning. The manuscript details how the course interweaves programming concepts with engineering problems, using real-life applications to foster a deep understanding of digital tools and AI-supported programming among students. We highlight the integration of Large Language Models (LLMs) like chatGPT into the workflow, as a progressive approach to stimulate students to be part of the rapidly evolving technology. The implementation of AI is discussed along 5 typical dimensions of practical programming. We emphasize the role of interactive notebooks in creating a dynamic and engaging learning environment that comprises a playground for generative AI. By incorporating AI-assisted programming, the course aims to streamline the learning process, in particular outside of class in home assignments, to enhance problem-solving skills, and to prepare students for the future challenges of life-long learning in engineering. Through this innovative educational model, students not only learn programming and engineering principles

[1] *Falk K. Wittel*
fwittel@ethz.ch

but also how to effectively integrate AI tools into their workflow, equipping them with the skills necessary for success in their further digital education.

1 INTRODUCTION

Digital competences are increasingly becoming a key factor for a successful engineering education. They enable students to be innovative and productive at the same time to succeed in an increasingly globalized and complex working environment. The classical frontal teaching scenario in lectures is unfortunately less suitable to build up digital competences, as they require a high degree of individual involvement and practical experience. At the same time, competences in digital learning need to be taught in a very early stage of studies, so students can benefit throughout their studies early on. A course about digital competences in engineering raises the following questions: Can today's universities offer each student during every Bachelor class with large student sizes an educative computer lab to individually explore numerical concepts, experience the effects of parameter choices on physical problems or engineering applications, and thus learn and experience principles of programming and digital tools while exploring engineering topics? Is it possible to address today's diversity of digital competences, including the application of Large Language Models (LLMs) while providing the cohesion and fundamental perspective Bachelor students need in a course?

In a first-year course on Digital Engineering (120-80 students, 3 ETCS), we meet these challenges by interlinking programming concepts with real-life problems, interactive web-based tools with autodidactic learning, and individual sense of achievement with group progress. The course starts as a programming course, embedding mathematical methods, but in its second part shifts towards forming general civil engineering skills. Python Jupyter notebooks are without exception forming the core of the teaching and learning experience. Consequently, no additional lecture slides or scripts are provided, since everything is generated from the collection of notebooks. This allows students to focus exclusively on working and learning with notebooks during lectures, exercises, and home assignments up to the final exam. Due to the use of Jupyter notebooks, everything is interactive, and students explore concepts in a playful way by versatile hands-on activities that are embedded into their notebooks.

The upraising of AI-based LLMs like openAI's chatGPT and others results in a controversial discussion on their role in university education (Memarian and Doleck 2023, Pradana et al. 2023, Balabdaoui et al. 2023, Garrel et al. 2023). The way we teach and learn digital competences in the future will change drastically, and some scholars even question the need to learn classical ways of programming at all. (Anagnostopoulos 2024). About 50 years ago, we saw the introduction of electronic calculators at universities, which meant freeing teaching from annoying, repetitive, time-consuming calculations. This enabled lecturers to spend more time teaching the essential subject-related skills. 20 years later, programmable calculators also solved eigenvalue problems, inverses of matrices or other error-prone problems that had devoured lecture, exercise, and examination time. As a result, the focus on core competencies could be further increased. LLMs represent an even bigger step. Within one year, the way we solve problems with computers has fundamentally changed due to the widespread use of LLMs. The speed at which new developments are introduced has even further increased to an incredible extent. Today, it is more than foreseeable that LLMs will quickly change the nature of digital skills and how they are taught in a drastic way. As a consequence, skills on productive work with LLMs in engineering applications have to become anchored in the basic studies. Thus, it has to be part of the digital skills of bachelor students (Muhsin 2023, Mollick and Mollick 2023).

In this manuscript we first describe the consistent notebook-based teaching and learning approach for a digital engineering course based on Python. We sketch the topical choice and draft the selected Jupyter notebook-based eco-system used in lectures and for self-study. Subsequently, we explain the AI-integration into the course. In the results section we explain the planned evaluation of the effect on student performance and finally we summarize the key points of the manuscript.

2 IMPLEMENTATION

Our approach is tailored on educating Bachelor students during their first year at the university, preferably after a first course in programming. The aim is not to educate software engineers or programmers, but to provide solution paths to practical engineering problems with Python. Python was chosen as reference language for the bachelor studies, due to its wide distribution, its potential, wide applicability, and open-source philosophy. Any approach chosen has to guarantee:

- A high hands-on part to practice reading - completing – writing – and checking of code,
- teaching cross-topic basic knowledge of relevant digital skills,
- encouragement for self-taught ways of working and finding solutions,
- empowerment of students to benefit from digital resources,
- develop students' digital problem-solving skills at an early stage,
- implementation of AI-assistance in the entire workflow.

These goals can be achieved by our notebook-based teaching approach.

2.1 A consistent notebook-based teaching and learning environment

Our teaching concept is visualized in Fig.1. We created a consistent web-based learning environment entirely based on interactive Jupyter Python notebooks of different nature, like lecture-, exercise-, and assignment notebooks that sequentially build on each other. All utilized programs and packages are open-source and run in a web-based Jupyter-Lab instance. Upon start-up of the instance, all new relevant material is pushed into the respective home directories from a git repository. This allows students to work on the course from anywhere on any platform with a simple browser and without the need for any local data storage and installations. The core content is interwoven with various embedded student activities, guaranteeing a high degree of cognitive activation due to interactivity. Additionally, notebooks comprise various tools for formative assessment and feedback, like embedded links to Moodle quizzes, classroom interaction via Speakup (SpeakUp), and multimedia content, when beneficial. Furthermore, we provide cohesion over multiple topical modules by providing tools to students that enable them to generate their lecture and exercise script based on their individually edited copies of all notebooks at any time and progress. To address different learning styles of students, we provide a script generator. This allows students to individually select topics for their scripts by excluding notebooks or collapsing notebook cells, or to extend it by own notes that are compiled into the pdf lecture notes. To achieve this, PyLaTex (Fennema-Nio 2023) is used in combination with a custom wrapper python script to obtain a consistent document.

During lectures and exercises, students work exclusively on their copy of the notebooks and progress all together with the lecturer, who is teaching from the notebook itself, run in presentation mode. As a consequence, students can focus exclusively on the notebooks as their only source from where lecture notes and lecture slides are generated. Weekly home assignments allow the students to consolidate their knowledge and earn bonus points in the final exam. To be able to cope with the work load from grading home assignments, those notebooks make use of an auto-grading procedure based on NBgrader, a tool that facilitates auto-grading assignments in the Jupyter notebooks (Jupyter et al. 2019, Brichet 2024) (see Fig.1). Our tool embeds Moodle assignments into the auto-grading environment. It automatically corrects all handed in notebooks by running test cases, providing individual feedback.

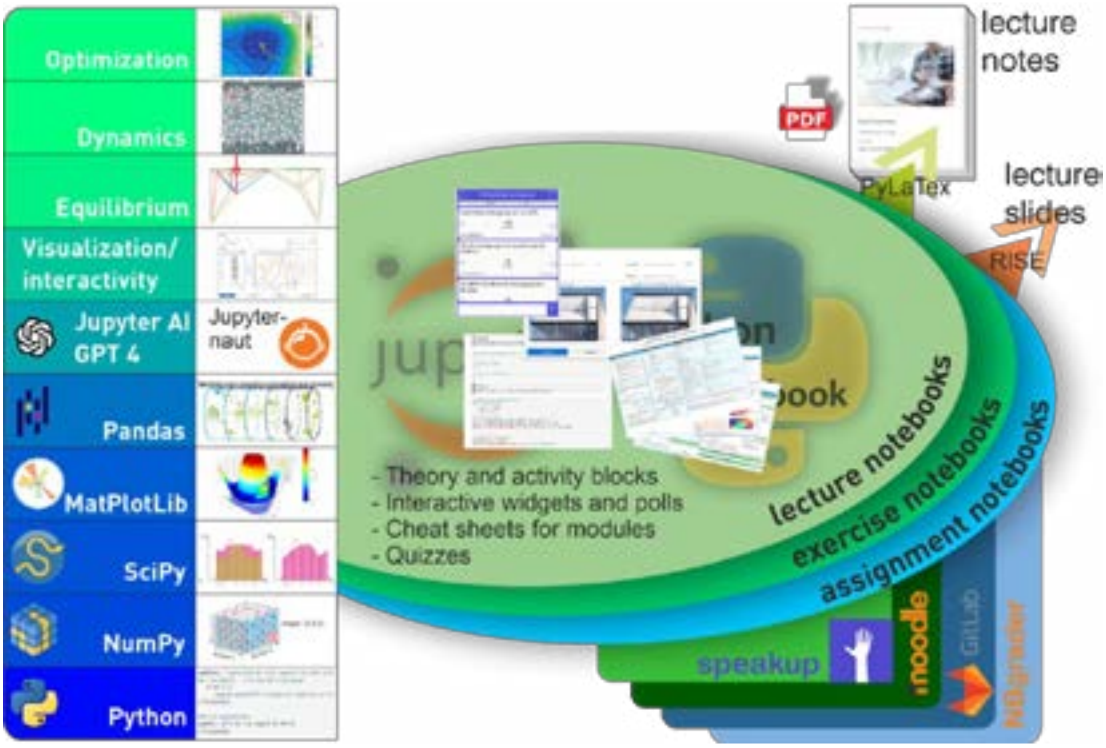

Figure 1.Scheme of modules and Jupyter notebook-based eco-system for lectures.

We build up diverse digital competencies in Python programming systematically, while exploring different aspects of engineering. Typical interactive Jupyter notebooks consist of two to three theory blocks, where key concepts are explained and up to three activity blocks, where the students apply the explained concepts, e.g., by complementing Python code or experiencing the effects of parameter changes in numerical models in a guided “playful” way. Exercises follow an identical pattern, with key concepts being repeated on practical examples from engineering. As an example, we investigate a model structure from various perspectives like time series analysis of structural oscillations, direct stiffness calculations, dynamic oscillations, and optimization. These topics are partly supported by demonstration experiments. During exercise activities, students receive support from the teaching assistants and finally have the possibility to compare their implementations to hidden sample solutions. Additionally, embedded classroom assessment tools like Speakup allow students to share observations and give feedback during the lecture.

As pre-knowledge on Python is very limited, we first address fundaments of the language and then discuss the most popular modules like NumPy, MatPlotLib, SciPy and Pandas. Learning with these modules is supported by a collection of cheat sheets that contain their most important core functions. We focus on fundamental, but relevant topics that students know from their basic courses, like linear algebra, numerical integration and differentiation, or interpolation. The relation to real life problems is particularly easy to establish in Pandas, where data from public sources on environment, traffic, pollution, or earthquakes serve as source. After students are accustomed reading and working with Python code, we discuss the use of LLMs, integrated into the Jupyter environment, as presented in Sec. 2.2. From there the second, engineering-related part starts, with the use of LLMs as AI-teaching assistant in exercises and assignments being mandatory. In our case those topics are visualization, equilibrium solutions, granular and structural dynamics and optimization, potentially serving as a motivator for future studies (see Fig. 1).

2.2 AI-integration into digital engineering education

Learning computational solutions for typical engineering applications relies on homework assignments as a central part of the learning process and success. We experienced extreme differences in the individually required processing times and thus productivity of students, that can result in personal frustration. A possible solution to this problem could lie in the integral application of LLMs. Our activity-intensive lecture series offers ideal conditions for imparting LLMs skills and establishing them as an integral tool for problem-solving. Anchoring these competencies in the first year as part of a large course offers students a new approach to sharpen skills and lecturers the possibility to understand how to integrate AI into their teaching.

The technical implementation is rather straightforward by using JupyterAI (Das 2024), a tool that embeds generative AI capabilities within the Jupyter ecosystem. This empowers students to benefit from AI while staying in their familiar Jupyter notebook environment. As foundational model, chatGPT4 is chosen, due the good quality of the answers and accessibility to API keys.

Five application skills of LLMs are outlined for our course that outsources programming tasks productively (see Fig.2) (Jing et.al. 2024). Those are addressed in the LLMs modules in a lecture and exercise. In detail, the 5 skills or dimensions are:

1 <u>Summarizing the functionality of code blocks or having it explained by the LLMs:</u> Models like chatGPT4 or Google Gemini are surprisingly good at breaking down even complex functions, such as particle simulation using the Störmer-Verlet method, into logical building blocks and explaining them. Here, LLMs offer a perfect opportunity for students to discover and understand code. The aim is to train students to integrate LLMs into their future workflow in order to understand new code blocks in a time-efficient manner. Hereby, they can identify which building blocks are suitable for their solutions and which not. For lecturers this gives the chance to teach also more advanced topics at earlier stages.

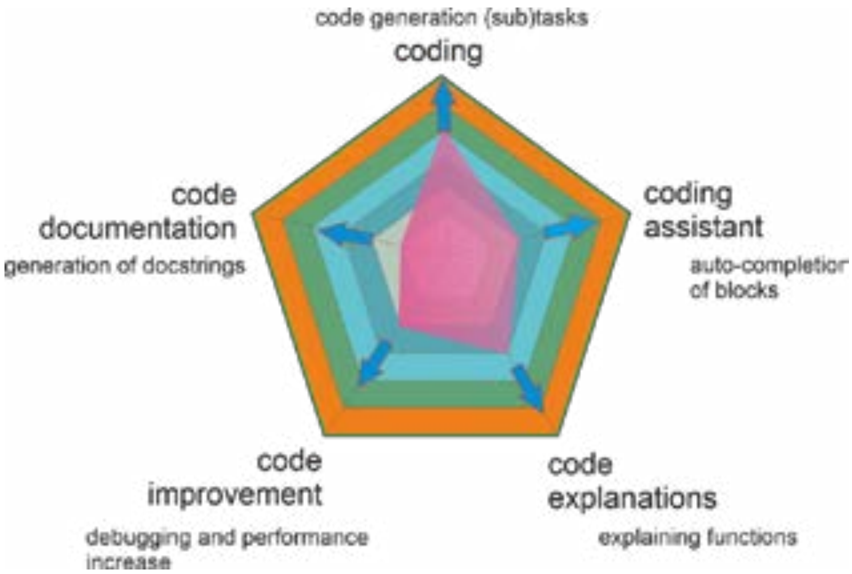

Figure 2. Dimensions of the AI-assistance in programming, developed in the course. Arrows resemble the expected improvement in the respective dimensions due to AI-assistance.

2 Integration of LLMs based programming assistance into the programming workflow for code completion: LLMs can be provide generative AI support via a chat user interface in the Jupyterlab sidebar or via magic commands in the notebook's code cells. We encourage students after the fundamental programming modules to use generative AI to complete code fragments in the assignments. Through AI-powered code suggestions, students will save time while they still gain programming experience. Of course, this does not exempt them from learning programming skills - but with the help of these tools, learning and broadening the horizon about programming approaches should become more efficient.

3 Code improvement: Debugging with LLMs and automated code reviews to identify potential errors: LLMs offers the ability to debug faulty code, suggest "best practices" and achieve higher performance. When assuming that in programming 1/3 of the time is spent on actual programming while 2/3 is lost on debugging, the potential for time savings for students is enormous. Of course, they still need the ability to assess the accuracy of the AI's "correction."

4 Automated generation of documentation for functions with LLM: LLM-based tools allow for the automatic generation of code documentations based on the analysis of code. Writing good documentation requires a lot of working time, which is the reason why it usually gets lost in the flow of work. At the same time, it is essential for the code's long-term use. By using LLM-based tools, we teach students about criteria for good documentation and how they can generate it in the shortest possible time, e.g., by generating docstrings or summaries for functions.

5 Generation of code blocks, graphical visualization, or widgets with LLMs: LLMs can generate code blocks through an appropriate problem description. It is not uncommon that fundamental errors are generated, which is why it is important that students can identify and correct them by targeted prompting. The time savings are still enormous, as they can provide inspiration for a good starting point as it points at possible solutions and functions in libraries that are outside of the previous experience of students. Another strength is that LLMs can

explain the structure of algorithms for solving engineering problems. This means that students receive practical help when working on larger blocks of tasks. In the exercises and homework, students practice how to prompt effectively in a way that useful code can emerge, how to critically judge the generated answers, how to refine the prompts for better answers, and how to use the generated code as a starting point for larger problem-based engineering tasks. Critical reflection on code accuracy and experienced limits of LLMs is another fundamental part of this dimensions, that requires active discussion with the students.

3 RESULTS

The teaching and learning concept are based on a high degree of interactivity in lectures and exercises, in which we exclusively work simultaneously with students on Jupyter notebooks. In those, theory and practical implementation alternate in activity blocks around engineering applications that form a motivating framework. An essential part of learning is through home assignments, which exhibit the largest discrepancies in student performance, and thus potential for individual frustrations. AI-supported workflows can be an important tool of learning support, promoting autodidactic learning and efficient problem-solving. By identifying different dimensions of LLMs support, students learn best-practices to profit from AI assistance by embedding it in their programming work-flow. They experience limits of generative AI, like lack of real understanding and moral, biases or hallucinations, inconsistent and redundant responses, or limited attention spans. By making the use of AI "mandatory" for home assignments while forcing critical reflection on its usage by providing mandatory fields, students have to fill in, they learn to judge the possibilities and drawbacks of AI-assisted programming more realistically.

During the home assignments we surveyed the reception of LLMs. Students highlighted the efficiency and accuracy of LLMs in solving various tasks, especially coding and mathematical problems. Specifically, tasks such as formulating and explaining concepts, writing code, and even handling programming assignments were frequently mentioned as well-suited for LLMs. However, many students commented on the necessity of closely monitoring the LLM outputs for accuracy. In majority, the integration of LLMs were perceived as advantageous in terms of speed and ease of completing tasks. Some students mentioned that LLMs significantly sped up their working process, particularly for theoretical concepts. For instance, one user highlighted that they could learn theory much faster with the help of an LLM. However, others pointed out a downside, suggesting that relying on LLMs for programming might discourage to acquire deep understanding, as users might focus on the provided solutions rather than learning the underlying concepts.

In an end-of semester survey among the students (n=42) students rated their experiences with chaptGPT for the tasks from Sec. 2.2 from 0-4, with 0 meaning very unhelpful, 2 neutral, and 4 very helpful. The use of AI for all tasks was seen as useful, but to different degrees. Explanation of code (3.26) was rated as most useful, followed by code generation (3.02) and code improvement (3.0). For code documentation (2.8) and improvement of programming concepts (2.4) the benefit for AI usage was experienced as less relevant.

Overall, students confirmed a positive reception towards integrating ChatGPT in the DE course (>83% highlight it as important and very important). Students recognize its necessity in todays digital competence education and the value in learning how to use it effectively. 70% of the students stated that they learned effective prompting through the course expressing a shift in their usage of ChatGPT from a simple search tool to a more dynamic, constructive application. The vast majority of students (75%) stated that they could overcome problems while working on their assignment with the help of AI and integrate it into their workflow (85%). Interestingly, almost 50% stated that it reduces the work burden, but that at the same time one would learn and understand less. We observe a split in the attitude, whether the use of ChatGPT increased the self-confidence for the solution of programming tasks. Concerns were raised about over-reliance on ChatGPT for exercises and assignments, to ensure foundational understanding and to maintain the integrity of task completion. Still, 75% of the students considered the 2nd semester to be the ideal time for introducing AI into their digital education.

4 SUMMARY

To summarize, while the importance of AI literacy cannot be overstated for future engineers, the manuscript and surveys highlight the need for a balanced approach where students can independently tackle tasks without over-dependence on AI tools, but still profit from productivity gain for standard works. The most crucial lesson learnt, is that lecturers need to streamline LLM usage to avoid overdependencies on LLMs. The following points can be seen as advice:

- Introduce LLMs only after teaching the fundamentals of programming language and competences.
- For new content we recommend not to rely on LLMs.
- One should stimulate LLM usage to be able to guide and stimulate positive and negative experiences students acquire with LLM usage.
- Set a focus on prompt design and encourage reflections on LLM reactions.
- Try to use an integrated AI of the programming environment.
- Stimulate its use for standard tasks, where errors are easy to grap and debug, like doc-string and plot generation or exception-handling.
- We don’t recommend LLMs for complex programming tasks where assessing the correctness of generated code is not evident.

LLMs proved to be particular successful in error detection and explanation, speeding up the debugging process. Due to this augmentation, more time can be spent on teaching core competences enriching the learning experience.

ACKNOWLEDGEMENTS

ABSTRACT

In recent years, work-life skills such as leadership, self-management, teamwork, and ethics have become increasingly integral to the engineering profession. However, it appears that traditional engineering education often falls short in equipping students with these essential skills. The development of social skills is fundamentally experiential and encompasses the entirety of an individual. In this paper, we introduce elements of impactful leadership pedagogy derived from our research and extensive practical experience in delivering (critical) leadership courses to engineering students. We engage students in a processual and contextual examination of leadership concepts, theories, and phenomena, while placing paramount importance on personal inquiry into their own thinking and agency

[1] *J.Ylitalo*

jari.ylitalo@aalto.fi

regarding leadership, influence and moral agency. Student feedback indicates that learning experiences have been transformative, for some, even life-changing.

1 INTRODUCTION

Professional skills essential for working life, such as teamwork, communication, leadership, and continuous personal and professional development, have become increasingly vital in the engineering skillset. The shift in the working environment from gradual change to a dynamically evolving VUCA (volatile, uncertain, complex, ambiguous) landscape has intensified the demand for ongoing communication, adaptation to change, and skill enhancement across all professions, including engineering (Millar et al., 2018; Deming, 2018). To meet these evolving demands, organizations have transitioned from rigid hierarchies to dynamic networks, embracing a more autonomous organizational philosophy and practice. This transformation is particularly evident in innovative technology and software companies. The emergence of new organizational structures necessitates advanced competencies in communication, collaboration, and personal and professional influence from all stakeholders.

Moreover, there is a growing expectation for engineering professionals to address and contribute to global challenges such as climate change, biodiversity loss, and societal shifts. Engineering professionals are both contributors to and mitigators of these challenges, as highlighted in the SEFI Conference's call for papers. Consequently, engineers must engage in discussions concerning the ethical implications of technology development and application. However, it appears that traditional engineering education often fails to adequately equip students with these essential skills and knowledge (Hirudayraj et al., 2020).

Developing skills on teamwork, collaboration, leadership, and moral reasoning and agency primarily requires experiential learning and reflection on these experiences. Unlike basic engineering knowledge, social sciences lack a singular theory, fact set, or method that can be taught and applied universally. Social reality is constructed through collective meaning-making, necessitating a willingness to critically examine personal values, thought processes, communication patterns, and actively engage in interactions to enhance one's influence. Thus, acquiring meta-skills for lifelong curiosity and learning about social influence within various professional contexts and relationships is crucial.

Many engineers eventually end up to managerial roles in their careers. It's widely recognized that true learning and adoption of managerial and leadership skills start occuring when individuals get into a position of authority. Some argue that teaching leadership to students is futile as they lack opportunities to apply these skills and knowledge in practice. However, we contend that there are valuable lessons to be learned during academic studies. We have been teaching leadership to engineering students as a team quite a while, and in this paper, we introduce our approach, which has been proven to cultivate deeper and more sustainable personal capabilities for moral agency and leadership within social contexts. Throughout our teaching, we have consistently explored a fundamental question: Should concepts of human interaction, leadership, and moral agency be taught differently to engineering students compared to, for example, business students? So far, our experience suggests that there are no significant differences between students from various disciplines and cultures. The decisive factor appears to be an individual's willingness to adopt a curious mindset, critically assess their own assumptions and ways of relating, expose themselves to new experiences, and reflect on these experiences for learning. Next, we will outline the theoretical foundations of our educational approach and its practical application, as well as discuss the potential for broader implementation

2 THEORETICAL FOUNDATION OF IMPACTFUL LEADERSHIP PEDAGOGY

In the exploration of leadership pedagogy, the initial inquiry often centers on the conceptualization of leadership itself: What exactly are learners expected to master? This question is followed closely by considerations of how leadership-related skills, knowledge, and abilities are acquired, and how educational contexts can effectively nurture and support this learning process.

Leadership enjoys widespread attention within social sciences, yet it eludes a single, universally accepted definition. The traditional leader-centric perspective identifies leadership through individual traits, competencies, characteristics, and behaviors. In contrast, more contemporary viewpoints recognize leadership as a contextual and relational phenomenon, co-constructed, manifested, enacted, and defined uniquely within each organizational setting (Collinson & Tourish, 2015). It is crucial, therefore, to differentiate between enhancing individual leadership skills and fostering collective leadership practices within an organizational context (Day, 2001).

Adopting a contextual and relational perspective, we view leadership as a continuously evolving interaction that involves all participants within a given context. This approach underscores the significance of collective meaning-making (Drath & Palus, 1994) and relational dynamics (Uhl-Bien, 2006) in the co-construction of leadership, along with the role of collective practices as foundational to its emergence (Raelin, 2011). Our stance aligns with the notion that leadership is an "essentially contested concept" (Grint, 2005), reflecting the diversity of phenomena and activities labeled as leadership across both practical and academic domains (Alvesson, 2018).

From this vantage point, leadership becomes relevant not only for current and aspiring leaders but for everyone. Leadership can be seen as an omnipresent, co-creative process, implicating all members of an organization—or any group, for that matter. In today's increasingly non-hierarchical organizations, where leadership capacity is expected from every level, understanding one's agency and influence becomes paramount. Formal leaders, despite their authoritative roles, are integral to, rather than separate from, this collective process. Recognizing this interconnectedness allows individuals to perceive, analyze, and actively participate in these dynamics.

Our approach to designing and delivering leadership courses is informed by our academic research, pedagogical strategy, teaching experience, and continuous refinement through reflection on our experiences and student feedback. This methodology extends from undergraduate courses to executive education programs, grounded in the belief that the core principles of learning and reflecting on fundamental social and human phenomena are consistent across all educational levels and various disciplines. Next, we delve into what we believe is essential leadership knowledge for (engineering) students and the elements that render our teaching impactful, using a Master's level leadership course, *Leading as Practice*, as an illustrative case study.

2.1 The content – what to teach and learn?

We see that in an undergraduate leadership class, understanding the essence of leadership is paramount. We typically begin with an exploration of students' existing perceptions of leadership, often shaped by their past experiences in various spheres such as work, volunteering, military service, and societal influences as well as on popular narratives. Additionally, we delve into students' aspirations for leadership roles, noting initial hesitations among some who feel they don't align with traditional heroic leader stereotypes, alongside those eager to pursue careers in business and industrial leadership. In the end of the course we ask the students to take another look and compare how their view of leadership has evolved through the learning experience.

Throughout the course, we emphasize that leadership is a dynamic, collective, and context-dependent process. We pinpoint that mastery in leadership involves four interconnected aspects: *1) becoming able to see underlying social processes and structures, 2) learning to know oneself: beliefs, values, and ways of seeing oneself, others and the world, 3) making active and deliberate choices on how to conduct oneself in order to have an impact on the world,* and *4) building capacity and practice for continuous personal learning and growth*.

A pivotal aspect of leadership learning is understanding its multifaceted nature, which we enable through familiarizing the students with different perspectives to leadership. We stress the importance of self-awareness, encouraging students to reflect on their worldview, understanding of human behavior, concept of knowledge, and core values. Central to this is recognizing that each person holds unique lenses through which he/she perceives the world, shaping his/her interpretations and actions. One key question to be explored is "*What are the lenses through which I view and interpret the world?".*

The next essential theme is to learn to comprehend one's environment, encompassing interpersonal dynamics, organizational cultures, and broader societal contexts. We see that acknowledging the interconnectedness of individuals and their surroundings facilitates understanding of social processes and informs effective leadership.

At the heart of understanding oneself as a leader lies adopting a systemic approach to one's environment and perception of it. This involves identifying key contextual factors that shape the social landscape where leadership unfolds, reflecting on personal interpretations, and making conscious choices to exert influence and actively engage in leadership endeavors. According to this view, "leadership becomes a process of thinking more critically and reflexively about ourselves, our actions, and the situations we find ourselves in" (Cunliffe, 2009).

We believe that by fostering an environment that encourages exploration, self-realization, and awareness of one's agency within social reality, students can cultivate a sustainable foundation for ethical leadership and influence. Through deliberate reflection and the refinement of perspectives, convictions, and practices, students can develop into morally responsible leaders and influencers.

2.2 The principles – how to teach and learn?

We assume that *first* crucial aspect of learning leadership is the willingness to critically examine one's own habitual ways of thinking, perceiving, interpreting, and making sense of social reality and contexts. This involves questioning ingrained assumptions and being open to new perspectives. *Secondly*, learning entails establishing a connection with one's past experiences while also consciously reflecting on new experiences gained through coursework. This reflective process is vital for synthesizing and integrating new knowledge. *Thirdly*, learners must familiarize themselves with key leadership concepts and theories to enrich their understanding and further develop their own leadership perspectives. This involves not only absorbing information but also actively engaging with and applying theoretical frameworks. *Lastly*, learning is a social endeavor that thrives on shared meaning-making and dialogue. By exchanging ideas, perspectives, and insights with peers, learners can deepen their understanding and refine their thinking collaboratively. In summary, effective learning involves willingness to challenge existing beliefs, reflection on personal experiences, engagement with theoretical knowledge, and active participation in collective learning processes. As educators, we must create environments that foster these aspects to facilitate meaningful and transformative learning experiences.

The anticipated learning approach is strongly rooted in constructivism, emphasizing the active (social) construction of new knowledge and understanding. Additionally, experiential learning (Kolb, 1984) is integral, necessitating reflection (Reynolds, 1999) and (critical) reflexivity (Cunliffe, 2004). Students often note that this learning method deviates from the norm in engineering education. We prioritize engaging students in active, intentional participation throughout the course. Our goal is to cultivate a psychologically safe learning environment where students feel comfortable sharing personal experiences, uncertainties, and evolving ideas. We strive to minimize power dynamics, foster open dialogue, address classroom dynamics, amplify marginalized voices, and reflect on the ethical implications of endorsing particular viewpoints.

In our learning environment, we place significant emphasis on encouraging students to explore their personal thoughts while also venturing into unfamiliar territory. Diversity of ideas is celebrated, but we equally stress the importance of quality thinking—ideas must be thoroughly developed and supported by relevant academic concepts and reasoning. As educators, we actively avoid perpetuating the conventional "orthodox" view of leadership, which may foster hubristic attitudes among students (Sadler-Smith et al., 2017). Instead, we adopt a facilitative role, drawing inspiration from constructivist learning pedagogy and critical pedagogy. In this approach, teachers are viewed as facilitators rather than authoritarian figures, guiding students through the learning process. While we embrace our role as representatives of academic scholarship and leadership knowledge, we acknowledge the importance of avoiding charismatic performances that reinforce the notion of the all-knowing, mythical hero narrative (Sinclair, 2009). Thus, as we shift away from the traditional view, our pedagogy must also evolve accordingly (Iszatt-White et al., 2017). We strive to embody the same principles in our teaching roles as we advocate within our classrooms, promoting a collaborative and inclusive learning environment.

Our students' initial perceptions of leadership often align with values and assumptions criticized in leadership studies (Alvesson, 2019). This underscores the importance of addressing leadership from the perspectives of values and assumptions to engage students effectively. The most influential management and leadership theories focus on beliefs and aspirations rather than theoretical constructs (Bridgman et al., 2016). We've found that challenging the orthodox view of leadership and presenting alternative perspectives not only captivates students but also prompts self-reflection, offering valuable insights into their own beliefs and assumptions.

3 IMPACTFUL LEADERSHIP PEDAGOGY IN PRACTICE

We offer a range of leadership courses, spanning from bachelor level to executive education, where we implement the pedagogical approach outlined earlier. In this paper, we aim to underscore the practical application of effective leadership pedagogy by focusing on one of our core courses in the Master’s level curriculum, titled *Leading as Practice*.

3.1 Course design and delivery

Leading as Practice (*LaP*) is a 5-credit course within the Master’s Program of Industrial Engineering and Management at Aalto University It takes a critical, relational, and reflexive approach to leadership, social reality, and human agency. The overarching goal of the course is to acquaint students with contemporary leadership theories and frameworks, empowering them to identify and analyze various leadership-related social phenomena, practices, and experiences through critical and reflective thinking. Moreover, the course aims to help students further develop their personal critical leadership thinking and practice while realizing their potential in learning leadership-related skills sustainably. *LaP* has been offered in its current format ten times, with minor adjustments made each year.

The student body comprises individuals from various engineering disciplines, predominantly industrial engineering and management. The proportion of international students fluctuates between 10% and 15%. Currently, there are some 40 participants each year, which is deemed optimal for the pedagogical approach employed, facilitating lively class discussions. Previously, the course accommodated over 80 participants; however, changes to the Master’s Program curriculum resulted in a decrease in enrollment.

The course consists of nine lectures, two substantial personal essays, six weekly "mini-essays," and a group assignment spanning a two-and-a-half-month period. The curriculum draws from nine articles covering a range of topics, including multi-paradigm perspectives and contemporary leadership theories, as well as themes such as inclusion and critical thinking. The introductory personal essay in the beginning of the course serves as a cornerstone for the coursework, introducing various paradigmatic perspectives on social reality. It underscores how biased theory construction can inadvertently endorse distorted management thinking and practice, while also challenging the prevailing heroic leadership narrative. This exploration of different paradigms and their influence on knowledge construction is often eye-opening for engineering students, shedding light on perspectives they may not have previously encountered. However, for some, it can also be perplexing, particularly if they have never questioned the dominant functionalist view of reality before.

Following the introduction, the course adopts a consistent weekly structure, with each session dedicated to reviewing an assigned article prior to the lecture. Three-hour lecture sessions prioritize mutual dialogue in small groups and as a whole class, fostering the development of ideas and insights gleaned from essay writing while also prompting new questions. Peer sharing is actively encouraged, enhancing collaborative learning.

Interwoven between group discussions are short presentations by the teachers, summarizing and highlighting key viewpoints from the discussions and texts. Midway through the course, students form five-person groups for a group assignment centered on their personal leadership experiences. This assignment aims to broaden students' perspectives by illustrating how their everyday experiences can be interpreted from diverse viewpoints, challenging any narrow or one-sided perceptions.

As a conclusion, students craft personal reflection essays, summarizing their learning journey. They integrate course materials and personal experiences to develop their personal leadership philosophies and ideas for implementation their learnings further. Additionally, students compare their initial leadership constructs and definitions, written at the course's outset, with their evolved understanding at the course's conclusion. The final workshop consolidates the learning process, as students share personal reflections and insights gained from group assignments. Moreover, students engage in coaching discussions in pairs, exploring their future aspirations in the leadership domain.

3.2 Course experience and feedback

The course has consistently garnered positive feedback over its duration, earning a reputation for being exceptional and distinctive (Morikawa, 2020). For many students, the experience has been transformative, leading them to orient their further studies and interests accordingly. However, few students have expressed contrasting views, perceiving the course as overly philosophical and conceptual, and desiring a more practical approach with concrete case studies and definitive answers. Nevertheless, those who successfully complete the course typically exhibit a high level of commitment and engagement. Each year, an impressive 65-75% of students achieve the highest grade, reflecting their dedication to active learning. Assessment in the course is based on personal and group essays completed throughout the duration of the course, with additional points allocated for class attendance. Emphasis is placed on personal, critical, and reflective writing in essay grading, along with the demonstration of adequate academic argumentation. Feedback from participants indicates that LaP-course holds significant value for many students and is regarded as one of the most impactful university courses.

A quote from the student feedback summarizes well the meaningfulness of the course experience: *"Honestly, the first real university course during my four years of IEM studies. That is, the first one that actually encouraged critical thinking in the way university courses should. Vast majority of the IEM courses train you to efficiently solve managerial problems by abstracting the organization into some sort of "mathematical machine" that an engineer is able to optimize. This was the first one to actually set a bigger picture relating to why do organizations exist in the first place* *and whose interests do they actually serve. The meta level of social scientific theories was especially eye-opening."(a student from the LaP-course 2018)*

4 DISCUSSION

In this paper, we have introduced our approach to teaching leadership in a manner that fosters meaningful impact as a part engineering curriculum. Drawing from our extensive experience, research, and exploration, we have developed approach to facilitate sustainable learning outcomes in our students' leadership thinking and skills. Based on our experience we argue that engineering students do not necessitate a specialized course approach on leadership when the aim is to develop deeper understanding of social dynamics, leadership and oneself. We see that impactful leadership pedagogy is grounded in constructivist and experiential learning, which diverges from traditional university teaching methods.

From the teachers this requires a facilitative and participatory role rather than positioning oneselves as sole authorities on knowledge. From the students learning requires to critically examine their own perceptions of social reality and to constructively scrutinize their own agency. Furthermore, the classroom experience should embody the very leadership principles the course is aiming to instill, and foster a psychologically safe environment for participants to freely share thoughts and questions.

We believe that future engineers must possess a foundational understanding of human dynamics within teams and organizations, coupled with a strong sense of self-awareness and the ability to cultivate professional relationships. Integrating the learning of teamwork and leadership into the engineering curriculum presents a challenge. One approach is to leverage project-based courses, providing students with real-world social experiences as valuable learning opportunities.

ABSTRACT

In complex project-based courses, students work with a high degree of autonomy, making it difficult to assess individual progress. Thus, feedback and grading are often based on the results, which neglects the applied methods. However, gaining an understanding of students' approaches to complex projects could enhance comprehension of team success or failure. Our hypothesis is that there is a correlation between the consistency of the sprint plan and sprint review and the team's overall performance in the competition. We introduce an approach to analyse the methodological effectiveness of student projects in their development approach.

70 student teams were requested to create a sprint plan at the start and a sprint review at the end of each of the five two-week iterative development sprints. The plan and review were based on four guiding questions for each sprint. A total of ten teams were examined, consisting of five high-performance and five low-performance teams. The teams were analysed quantitatively, and the consistency of sprint planning and sprint review was analysed qualitatively for one team from each group. Successful teams ran more tests and developed more prototypes and thus, delivered

[1] *M O Zander*
mzander@ethz.ch

more profound results. The high-performance team formulated results clearer and more precisely and is more consistent throughout sprint plan and sprint review compared to the low-performance team.

1 INTRODUCTION

Project-based education is well established in engineering education (Türk, Leutenecker, and Meboldt 2014; Condliffe et al. 2017). Students are usually graded solely based on the results of their projects (Krajcik and Kongju 2014). However, this approach does not directly consider the methods learned and applied by the student teams, which is a fundamental learning goal (Ríos et al. 2010). Gathering and analysing such data is challenging, especially in large classes (Condliffe et al. 2017; Ralph 2015). Such data could help in understanding how individual teams work and could provide insights into why teams are either successful or unsuccessful. It may ultimately enable the development of indicators for early interventions. The aim of this approach is to establish a basis for analysing qualitatively and quantitatively the correlation between methodological application in student project work and system performance, highlighting the significance of the learning process.

A fundamental concept of project-based learning is learning through failure (Zhang et al. 2022; Tawfik, Rong, and Choi 2015; Barron et al. 1998). Agile development has proved to be an ideal method to create such environment (Neumann and Baumann 2021; Omidvarkarjan et al. 2020; Batliner et al. 2022; Beck et al. 2001). It forces students to iteratively build and test prototypes, which, especially in complex projects, provokes failure and thus learning at some point.

We propose a method, which considers quantitative and qualitative data, to investigate how students approach the overall project goal by breaking it down into sub-goals and systematically create data-based results to build up their knowledge.

1.1 The Study Context

The subject of the study is a student project in which teams of students developed a physical product over a period of 10 weeks (Türk, Leutenecker, and Meboldt 2014). Approximately 350 students participated in this course, organised in teams of four to six members. The students were taught the basics of agile hardware product development. A key challenge of product development in mechanical engineering is to translate the requirements and problem statement of a specific use case into a technical system. The system must perform well in its intended use case, while meeting additional requirements.

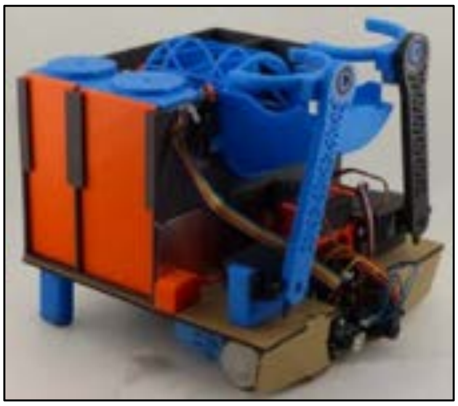

Fig. 1. Result of a high-performance team

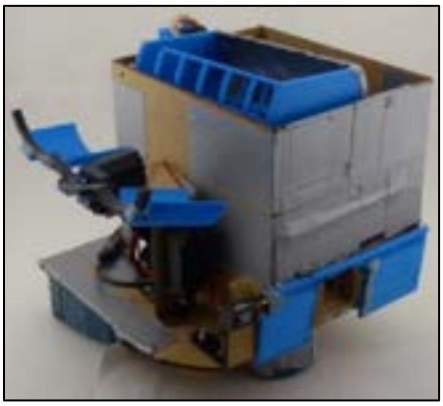

Fig. 2. Result of a low-performance team.

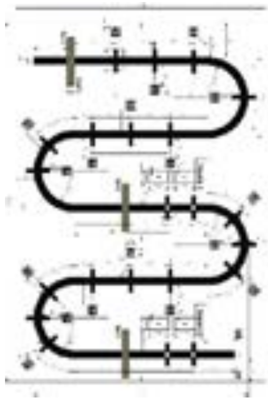

Fig. 3. Driving circuit.

The students were challenged to design an autonomous garbage truck prototype (*Fig. 1* and *Fig. 2*), which could collect mixed waste (black beans and bottle caps), separate and dispose the waste at two landfill sites along a designated route (*Fig. 3)*. The prototype had to comply with size and weight regulations and navigate past checkpoints. The teams received a mechatronic platform and access to a workshop infrastructure, including laser cutters and 3D printers. The objective of each team was to develop a working system and compete in a competition against other teams. The teams that perform best in the defined use case wins the competition.

The educational setting is based on teamwork, where students can apply their theoretical knowledge from different subjects of the first year of the bachelor's programme and acquire skills to master a complex development challenge from the idea to a fully working system. The development process includes mechanical and electrical design, manufacturing, assembly, programming, and testing.

The teams have a high degree of autonomy in their decision-making processes within a framework of minimal constraints. Emphasizing agile hardware development methodologies, the course guides students in adopting agile practices tailored to their project needs, particularly in formulating sprint plans. A sprint is a repetitive timeframe, which consists of the three increments plan, review and retrospective and during which specific work must be completed and made ready for review (Fuior 2019). For this course, each sprint was set to two weeks. Navigating effectively through this process, from an idea to a working prototype, demands a meticulously planned breakdown of the overall system into smaller, testable subsystems. These subsystems can then be individually tested and integrated step by step into the overall system. The progress and learning and the performance of development teams can be assessed by the ability to divide the overarching objectives into measurable, short-term sub-goals and the precision with which the results of prototype testing align with the period defined sub-goals of the development plan. These goals facilitate cohesive team efforts and knowledge synthesis.

The specific self-defined development tasks and intermediate results vary between teams. It is challenging to compare the progress of teams. The students should primarily learn how to break down complex, long-term development goals into smaller, testable sub-objectives and to plan and execute a project with high degree of uncertainty over longer time in a team. This approach systematically builds up the knowledge required to eventually solve the initial problem and build the final system. The evaluation focuses on how well a team develops the results of a sprint and how closely the objectives defined before a sprint match the results of the sprint, including the lessons learned for planning the next sprint.

We assume that the performance and learning of teams can be assessed through the comparison of sprint plan and sprint review. We assume that the quality of this alignment correlates with the overall success of a team.

2 METHODOLOGY

In total, 70 teams participated in the course. The ten-week project was split into five sprints of two weeks each. For this study, quantitative data collected from ten student teams and qualitative data of two teams were analysed. We compared quantitatively the five teams with the highest (‘Top’) and five teams with the lowest (‘Bottom’) score in the competition and exemplary analysed one team of each group (Top and Bottom) qualitatively.

General information regarding team size, age and invested average time per week of the Top and Bottom groups was collected via a questionnaire at the end of the course and are presented in *Table 1*. The teams on average were of the same size and age. The text data from the Top and Bottom groups was analysed qualitatively and quantitatively.

Table 1: General information on the Top and Bottom groups compared to the course. Data was assessed by questionnaires and then averaged.

	Top (n=5)	Bottom (n=5)	Course (n=70)
Team size	4.80	4.80	4.81
Age (in years)	20.13 ± 0.56	21.26 ± 1.19	20.82 ± 0.99
Time (h/week)	9.7 ± 2.65	11.4 ± 4.40	10.44 ± 3.89

2.1 Quantification of learning throughout a sprint

The quantification of textual data focused on the number of clear goals and tests defined per sprint, results per sprint, words per sprint goal and per result and the number of prototypes and tests per results. Clear goals, tests and results were classified manually. The average and standard deviation was calculated to compare the Top and Bottom group with each other.

2.2 Qualitative consistency analysis of sprint plan and review

Each team was asked to complete online plan and review surveys during each sprint. The questions of this survey are shown in *Table 2:* The structure of the sprint plan and sprint review documentation was framed around four leading questions, which correspond. In the planning phase, the student had to formulate a hypothesis based on ‘We believe that...’ (P1). After the sprint, they should provide evidence for this hypothesis in the form of ‘We now know that...’ (R1). Furthermore, the students were asked to formulate a test case in the sprint plan, which included a measurable metric and test validation (P2, P3, P4). The review included further information about the result (R2, R3) and the learning in form of a reflection on the hypothesis (R4). This resulted in forty textual data fields for each team. Based on the gained knowledge, the new sprint plan was designed. This procedure was repeated until project completion.

Table 2: *Sprint plan and sprint review guiding questions. Corresponding questions colorized.*

Sprint Plan			Sprint Review		
Goal	P1	We believe that...	We now know that...	R1	Result
Test Case	P2	To verify this, we will....	This was determined as follows…	R2	
	P3	This is how we will measure it…	The measurement results showed…	R3	
	P4	We are correct in our assumption(s) if…	Our assumption(s) was (were)…	R4	Reflection

The sprint plan and sprint review of one Top and Bottom team each were analysed regarding consistency and content. This demonstrates the proposed qualitative analysis methodology. To reduce complexity, we focused only on the second sprint plan and review. Review questions R2 and R3 were neglected.

A successful agile development project can be characterized by a consistence sequence (C4, *Fig. 4*) of consistence sprints (C1-3, *Fig. 4*). Consistency addresses four steps in a sprint, from hypothesis and goals, test case, results to reflection and, between two sprints, the sprint plan derived from the previous sprint review. The delta between the sprint plan and review represents the amount of gained knowledge about the system, which corresponds to the learning during this period. This was quantified by the number of hypotheses and results, and qualitatively assessed through the evaluation of tests, prototypes, and the logical consistency and clarity of sprint goals, to determine both the quantity and quality of learning. This could predict team performance in the competition.

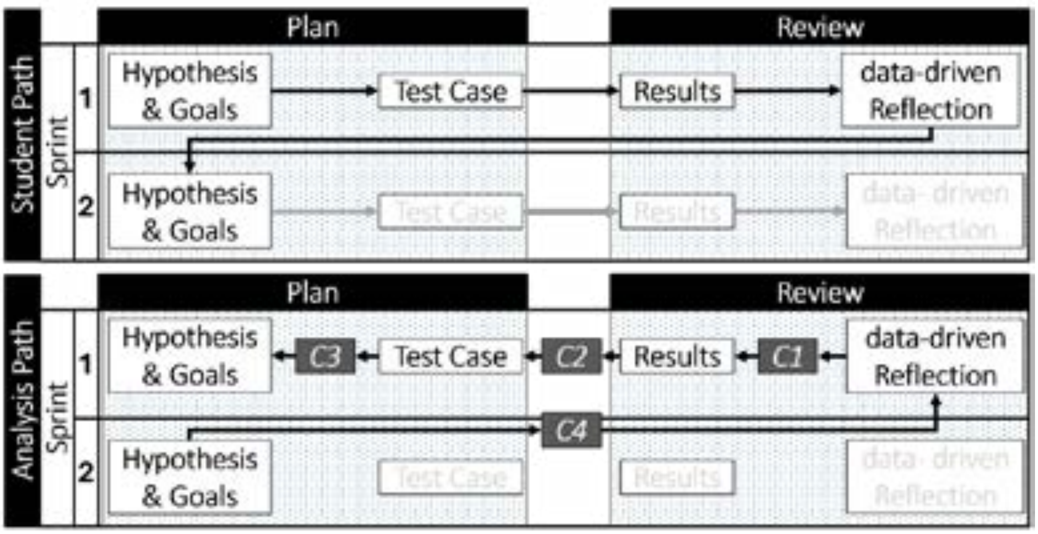

Fig. 4. Schematic of consistency analysis process (grey blocks labelled ‘C1’- ‘C4’) and the student’s documented work during each sprint (white blocks). Exemplary for one cycle. The plan and review from the students were used for data collection.

3 RESULTS

3.1 Quantitative comparison of sprint goals, tests, and results

The results of the quantitative analysis of the textual data are shown in *Table 3.* The Top group defined an average of 0.87 more goals per sprint than the Bottom group. The Top and Bottom group reported about the same number of results per sprint. When formulating the sprint goals, both Top and Bottom group used a similar number of words per sprint goal. However, for the sprint results, the Bottom group used on average 6.90 more words per sprint result than the Top group. The Top group run more tests and developed more prototypes per sprint.

Table 3: Quantitative text analysis of sprint plan & sprint review characteristics of the Top and Bottom groups.

	Top (n=5)	Bottom (n=5)
Goals per Sprint	4.56 ± 2.36	3.69 ± 1.31
Results per Sprint	3.98 ± 1.34	3.97 ± 1.13
Words per Sprint Goal	10.20 ± 2.97	12.5 ± 4.08
Words per Result	11.70 ± 3.15	18.60 ± 10.98
Prototypes per Sprint	5.45 ± 1.83	4.82 ± 1.62
Tests per Sprint	7.99 ± 3.69	4.88 ± 3.82

3.2 Comparative consistency analysis of two teams

Figure 5 presents the second sprint plan and review of two teams, one of the Top and one of the Bottom groups. Due to space limitations, we focused on the questions P1-P4, R1 and R4.

The Top team defined four specific technical sprint goals (P1): building prototypes for the gripper, the waste container, the emptying mechanism and optimizing the existing sorting mechanism. The team used a decisive tone to formulate the goals, facilitating reader comprehension of desired outcomes. In contrast, the Bottom team focused on team workflow organisation and brainstorming. No technical goal was defined. The tone is indecisive.

The Top team defined test cases (P2-3) for the development of the gripper arm, the emptying mechanism, and the sorting mechanisms. They formulated multiple questions to address the measurement of their test, with a focus on the gripper arm and partially on the sorting and emptying mechanisms. The Top team described how to validate their findings regarding the gripper arm. The Bottom team defined no clear test case nor a measurable verification method but agreed on team workflows. The team did not provide a clear definition of what constitutes a desirable or undesirable number of ideas.

The Top team described compact four core results (R1) of their test, addressing the gripper arm (pick-up system) and emptying mechanism. The Bottom team's results review contrasts greatly with their sprint goals in both form and content. The results are described in meticulous detail. The table displays only one-third of the sprint results due to space constraints. The team described the brainstorming results and next steps in a structured manner including prioritization.

The Top team reflected on their assumptions (R4) of the pick-up system, emptying mechanism and sorting system. The Bottom team reflected on their assumptions in one sentence, concluding that their developed ideas during this sprint should work theoretically.

The Top team mentions the gripper arm in each answer (P1-4, R1, R4), and the emptying mechanism (P1-3, R1, R4) and sorting mechanism (P1-3, R4) in most answers. Except for the sprint goal, the Bottom team only mentions either the teamwork or brainstorming in the following answers to P2-4, R1 and R4.

	Plan				Review	
Team	We believe that...	To verify this, we will...	This is how we will measure it...	We are correct in our assumption(s) if...	We now know that...	Our assumption(s) was (were)...
Top	In Sprint 2, we will complete a first version of the gripper arm, build a prototype for the waste container and emptying mechanism, optimise the prototype of the sorting mechanism	Mount the test arm on the driving platform and have the waste bins collected.	Is the gripper arm in the rest position within the size limit? Does the gripper arm grip the bin reliably? Does the reach arm lift the bin without spilling waste? Does the gripper arm empty the waste in the correct place? Does the gripper arm put the bin back in the right place undamaged? Does the emptying mechanism empty the waste reliably? Does the sorting mechanism sort the waste correctly?	The gripper arm works according to the test criteria and the prototypes provide insights for further development.	The servo power is sufficient and cannot be supported by a spring. The pick-up system is not yet fully developed. Decanting the cup is more difficult than expected.	The servo power for lifting the arm could be scarce (50% of the specified power would already be needed to lift the cup if the arm is assumed to be weightless and the system frictionless). The pick-up system is fully developed. Transferring from the cup to the sorting system does not present any major difficulties.
Bottom	We need to make some changes to the way we work in terms of brainstorming. Up to now we have only been able to define concrete ideas for subsystem 3 (filtering) extremely slowly. In future, we will approach this process much more efficiently and possibly work on different ideas in parallel.	From now on, we will each work on our own concepts and present the results to each other at the meeting.	The success of this plan is measured by the number of qualitative ideas	Our ideas are much better in the future.	1. we will develop our 3 ideas from subsystem 3a with priority. Priority 1: Idea 3a-1 (coin filter, see "Done Sprint 2"), combination with Idea 3a-3 if necessary (i.e. introduce vibration) Priority 2: Idea 3a-0 (half cylinder, see "Done Sprint 1") Priority 3: Idea 3a-2 (cylinder with spiral) Of these, Idea 3a-1 is the simplest, as no servo / motor is needed. It also works well in the test. Idea 3a-0 needs motors but also works well. Idea 3a-2 works but seems rather complicated. (*)	All ideas should work in theory.

Fig. 5. Exemplary sprint plan and parts of the sprint review of sprint two for one team each of the Top and Bottom group. Key words are highlighted in grey. (*) The result entry ('We now know that...') of the Bottom team was shortened to fit the cell

.

4 DISCUSSION

Our findings support the broader educational theory that iterative processes, as promoted by agile methodologies, enhance learning by allowing students to learn from failures and continuously improve their work (Zhou, Kolmos, and Nielsen 2011). We propose the use of qualitative and quantitative metrics for analyzing team performance, which aligns with the trend towards data-driven decision-making in education (Mahnic 2015).

4.1 Analysis of sprint results and team efficiency

The Top group reported the same number of results per sprint as the Bottom group, despite defining more goals, running more tests, and developing more prototypes. This may indicate that the results were investigated more thoroughly, are more profound and trustworthy (Fernandes, Dinis-Carvalho, and Ferreira-Oliveira 2021).

The lower word count per result may support this, as it suggests that the Top group was able to express their findings more clearly. Clear and explicitly communicated results can improve the value proposition of the group, which is an indicator of successful teams.(Cooper and Sommer 2016; Duehr et al. 2021; Marquardt, Choon Seng, and Goodson 2010) Defining more specific sprint goals may indicate that the team is clearer about what it wants and what needs to be done to achieve the overall project goal (Liu et al. 2019).

The top group invested less time on average in the project, suggesting greater focus and efficiency. This could also indicate advanced usage of agile methods, which may have reduced the development time (Pócsová et al. 2020). This is a counterargument to the often-assumed idea that low performance is due to low team commitment or ambition.

4.2 Comparative evaluation of consistency analysis of sprint plan and review

A clear sprint plan consists of well-defined hypothesis or goals and test cases, which are easy to understand for the entire team (Neumann and Baumann 2021). It must be clear what is being tested and how the hypothesis can be evaluated, which underscores the significance of clear and concise communication in project documentation and reporting (Rush and Connolly 2020). Overemphasis on planning without empirical testing leads to inconclusive outcomes, whereas excessive prototyping without a strategic framework result in resource inefficiency. Therefore, the optimal strategy entails a balanced approach that harmonizes theoretical groundwork with practical experimentation, thereby facilitating a path to project success.

The display of the sprint plan and review of two teams showed two very different approaches to the project, but also to answer the questions. While the Top team focused exclusively on technical issues, the Bottom team also addressed the teamwork. A sprint usually ends with a deliverable, a minimum viable product. With this plan, the Bottom team was doomed to failure.

The Top team demonstrated consistency throughout the sprint plan and review (C1-C3) by setting goals, designing a test case for these goals and showing results addressing the tests. However, the change of wording from 'gripper arm' to 'pick-up system' decreased comprehensibility. On the other hand, the Bottom team was inconsistent. The test case was not logically derived from the goals (C3) and the results did not easily follow the test case (C2). The results were unexpected due to the vague and unspecific description of the goals and test cases. The team was unclear on what to do, resulting in an unclear understanding of the expected outcome. As a result, the team described everything as a result, possibly creating confusion and a lower team value proposition.

Both teams state goals for the sprint. However, the Top team’s language and tone indicate a concrete and clear proceeding, whereas the Bottom team appears insecure in their plan (‘we will’ vs. ‘we need to’ / ‘possibly work on’). The usage of words such as ‘some', 'much more', and 'possibly' require clarification and a metric for quantification. The Bottom team's desired changes for their teamwork and brainstorming are unclear.

Both teams describe their approach to achieving the set goals. The Top team provides clear metrics for measuring and validating their progress. In contrast, the Bottom team‘s metric for measuring and validating their progress are vague and unspecific. Measuring the sprint success solely on the number of generated ideas may appear arbitrary and disorganized. It is unclear, how the team intends to assess whether future ideas are ‘much better’.

Although the Top team provided a concise description of the results, the sprint goals were not clearly identifiable due to inconsistent wording between the plan and review. The Bottom team's extensive use of new information and terminology made it challenging for the reader to understand the content. In contrast to the Bottom team, the Top Team described negative outcomes as well as successful outcomes, which shows critical thinking and looking at the whole picture.

Neither team explicitly reflected on whether their goals or assumptions were met or correct (C1). Instead, they repeated their assumptions. However, the Top team's assumptions can be partially reflected in the results, which partially address their sprint goals, whereas it is difficult to do the same for the Bottom team's results due to the unspecific sprint plan.

Translating the qualitative criteria into a measurable metric would enable statistical analysis of large classes with large data sets (López-Alcarria, Olivares-Vicente, and Poza-Vilches 2019). There is a huge workload connected to manually analyse qualitative text data. It is tedious and prone to bias. Applying such analysis approach to large classes is practically not feasible. However, the latest developments of large language model and the analysis of big text data may facilitate this and must be investigated in future studies.

5 CONCLUSION & OUTLOOK

The quantitative analysis showed that Top teams developed more prototypes and ran more tests per sprint, which led to more profound results. The qualitative analysis showed that the Top team was more consistent in the formulation of the sprint plan and sprint review.

This paper introduced an approach to analyse the project process qualitatively and quantitatively and highlighted the importance of monitoring the continuous progress throughout the entire project. This may eventually allow predictors to evaluate and provide formative feedback to teams during the early stages of development. The qualitative comparison of two teams demonstrated the underlaying challenges of a standardized and automated analysis of the sprint plan and review. Teams may have completely different approaches to the project and may be at different project stages. An appropriate metric is key to overcoming these challenges. Analysing large text data by hand is not only time-consuming and tedious, but also prone to bias. Large language models may enable new possibilities, decreasing manual labour and bias.

ABSTRACT

Departing from Active Learning processes, this workshop proposal showcases Learning Station (LS) model as an innovative teaching and learning practice, that enables the modular reconfiguration of learning landscape in higher education institutions. As the LS model is generated concerning individuals' ability to construct their own learning experiences in line with their strengths and preferred learning styles, it also transfers the ownership of learning to learners, requiring a shift from mere instruction to mentorship on the teachers' side. LS model further enables the co-creation of knowledge with all the relevant stakeholders of any learning experience in interactive ways. This workshop invites the participants and the SEFI audience to explore more on this model with the hands-on experience and through a Training of the Trainers program.

1 INTRODUCTION

1.1 Motivation and background

Active learning (AL) is an umbrella term for pedagogies and a broad range of instructional activities that focus on student activities and student engagement in the learning process (Prince, 2004, p.223; Roehl et al., 2013, p.45). AL requires learners to engage in doing things and thinking about what they are doing (Prince, 2004, p.226), as opposed to traditional lectures where learners are often passive recipients of knowledge. Knowledge construction instead of knowledge absorption; critical consideration of learning materials instead of replication and regurgitation of knowledge stock; problem-solving with independent thought, and a deeper understanding of phenomena are amongst the characteristics of AL (Roberts, 2017, p.64), all of which significantly require considerable learner engagement. Empirical evidence shows that the traditional instructional methods often fail to address the learning preferences of young people, who often have less tolerance especially, for the lecture style instruction (Roehl et al., 2013, p.45). Due to the increased interest in AL in the last few decades, instructional designers continuously expand the portfolio of AL methods under the broad categories of individual activities, paired activities, informal small groups, and cooperative student projects (Zayapragassarazan and Kumar, 2012, in Roehl et al., 2013, p.45), which may include several strategies such as conceptual mapping, brainstorming, collaborative writing, case-based instruction, cooperative learning, role-playing, simulation, peer teaching, project-based learning, along with others.

However, while many AL approaches, methods, and tools co-exist in various learning environments and contexts along with classical pedagogical approaches, current educational framings and practices do not provide the *flexibility* needed to use them in a complementary way, although using the right pedagogical approach at the right time and in the right environment is a prerequisite for benefiting from the creative potential of young learners in line with their preferred learning styles, strengths and talents that correspond to alternative ways of *knowing*, *thinking*, *feeling* and *doing* through different learning modalities.

The workshop proposed aims to introduce an innovative teaching and learning model – The Learning Station (LS)- which has been embedded and piloted in various international projects by the Istanbul Technical University Centre for Excellence in Education (ITU CEE). The LS model is also at the focal point of package 6 (‘Innovative Teaching and Learning Hubs’) of the EELISA European University project (eelisa.eu) aiming to “foster the use of and facilitate the exchange on innovative pedagogies, and to support the modularization of educational offers through architectures and complementary IT-processes”. The Turkish Ministry of education is amongst the collaborators of the model which aims to re-design the ‘Playground of Learning’ in a modular way to facilitate the co-creation of learning experiences in education institutions in collaboration with the relevant internal and external stakeholders of the topics of interest, while allowing the complementary use of alternative pedagogical approaches by students, teachers and mentors. Introduction of the LS model to the SEFI community is likely to generate fruitful discussions relating to AL, co-creation, and stakeholder engagement for improving the quality of learning experiences within the higher education ecosystem.

1.2 Target audience and learning outcomes

While the typical use of the LS model within the context of AI prioritizes its use by students for designing learning experiences for themselves in a given topic through the guidance and mentorship of teachers, academics who teach in universities and the administrators who are in charge of the design of educational activities in their institutions will be the specific target audience of the proposed workshop. The workshop, which will be organized in the form of a ‘*Training of the Trainers’* (ToT) Program, will allow its participants to:

- understand a novel approach that organizes the learning landscape in a modular way to allow the use of alternative pedagogical approach;
- explore how the diverse stakeholders of learning experiences can be incorporated into the process to improve the quality of teaching and learning; and
- explore alternative strategies to benefit from the creative potential of young learners when co-creating high-quality learning materials.

1.3 Significance

One of the main strengths of the LS model is that it allows the multiple and complementary use of alternative AL approaches, each of which is likely to function better in different learning environments. Instead of placing overemphasis on a particular AL approach (e.g., project-based learning, research-based learning, experiential learning, cased-based learning etc), the proposed workshop will rather focus on how they can be combined in a value-adding way to transform the traditional learning environments to allow “knowing, thinking, feeling and doing” with a holistic framework. Lessons learned from various international projects relating the use of the LS model will also be shared with the participants.

2 METHODOLOGY

The multi-stage format of the Training of Trainers (ToT) Program, which has been tested in various projects, will be adapted to the participants of the SEFI workshop (see Fig.1 and Fig. 2). Following sub-sections explain the workshop design and introduce the relevant materials.

Fig. 1. A screenshot from the ITU CEE process chart for the ToT

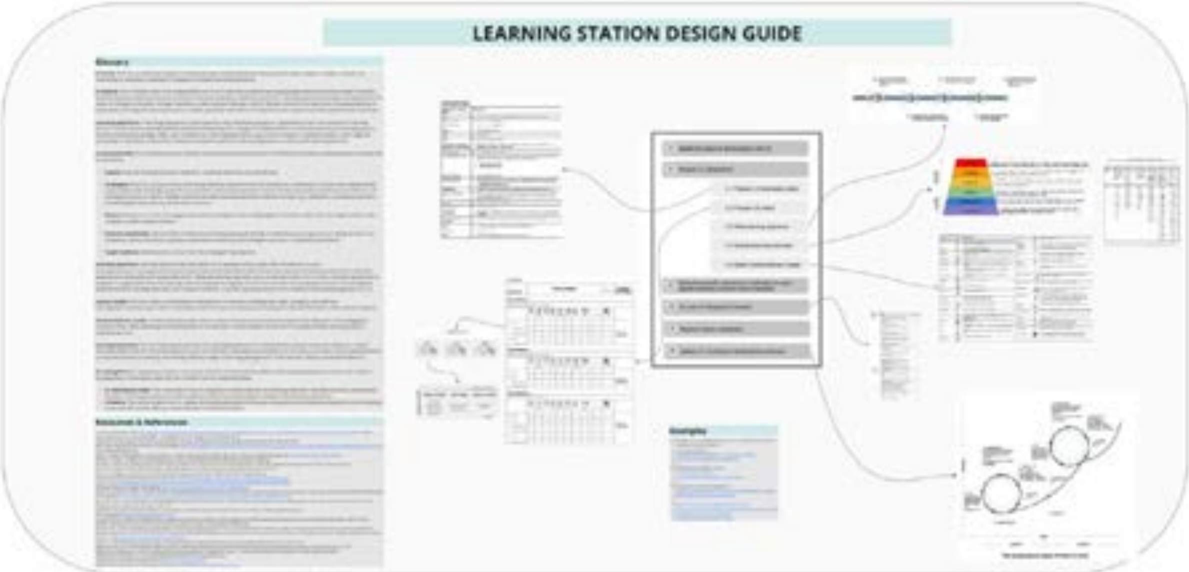

Fig. 2. A screenshot from the ITU CEE content for the ToT

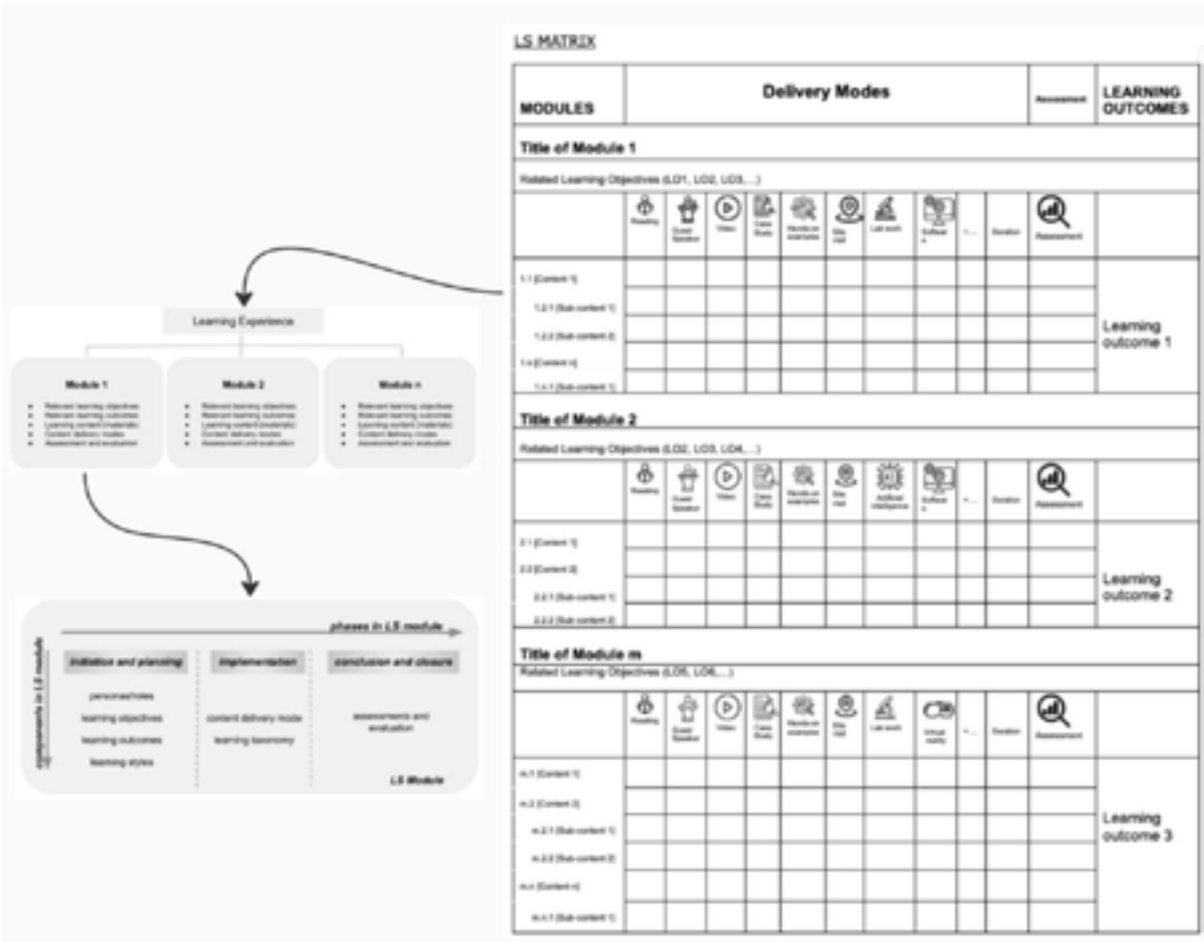

Fig. 3. *A screenshot from the ITU CEE content for the ToT*

2.1 Pre-workshop activities

SEFI community will be invited in advance to an introductory webinar on the Learning Station (LS) model, before the annual conference starts. The webinar will introduce the fundamental building blocks of the LS model and include a Q&A session to address the questions and concerns of the potential participants of the ToT program. The Learning Station Design Guide, the LS Design Toolkit, and the link of a Miro board including all ToT materials will be shared with the participants at the end of the webinar. A second registration form will be sent to the participants of the webinar to clarify the participants of the SEFI workshop and they will be asked either as individually or groups to indicate the topics on which they will be expected to design their LSs. Re-design of existing courses with the LS model or the proposal of new courses or other types of learning experiences will be acceptable. ITU CEE will provide live support from the Miro board to the LS designers until the SEFI workshop and arrange on-demand online sessions, if needed, to give feedback to their LS designs and address challenges.

2.2 Workshop activities

After a short introduction and an icebreaker exercise, the workshop will continue with the presentations of individuals or groups who have designed LSs. A group discussion will follow to allow all participants to share experiences and give feedback to each other for exploring the ways to improve the use of the model for enhancing the quality of teaching and learning in different engineering and related disciplines. An exit survey will be shared with the participants of the workshop at the end of the session to get structured feedback.

2.3 Post-workshop activities

Based on the exit survey, a feedback report will be prepared and shared with the workshop participants after the SEFI conference. Additionally, an online feedback session will be organized to discuss the report and explore potentialities for the future use of the LS model. Meanwhile, ITU CEE will keep the live support (Miro board) open to all participants of the workshop who want to further improve their LS designs.

3 RESULTS

Based on lessons learned from various, international projects, the proposed workshop introduced a flexible and innovative model that aims to re-organize the learning landscape of engineering and the related fields with a modular mindset that allows the use of alternative AL approaches that co-exist in the current learning environments in a complementary way. In total, 13 researchers from various universities participated in the workshop. Following a short introduction of the LS model, the hands-on part included a group exercise which aimed to design a learning experience relating to various topics selected by the participants themselves. Following the completion of the exercise, feedback were given to each group and the workshop was finalized with a Q&A session and group discussion on the LS model. Exploring ways for engaging with the stakeholders of the higher education system to improve the quality of learning and teaching materials and co-creating high quality content with learners were amongst the outcomes from the workshop. Results from the workshop was also instrumental to conceptualizing the 'Co-learning Lab 2024' of the ITU, in addition to revising and publishing the 'Learning Station Design Guide'.

***Conference Key Areas**: 15. Building the capacity and strengthening the educational competences of engineering educators, 11. Engineering skills, professional skills, and transversal skills.*
***Keywords**: student-centred learning spaces, teaching and learning design, scaffolding, collaboration and reflection.*

ABSTRACT

We see a growing interest in learning spaces that facilitate collaborative learning. Research has shown that student-centred approaches and peer interaction improve student learning and therefore should be incorporated in the teaching and learning design. However, for a teacher, this transformation to a student-centred approach requires support and guidance, and there is a need for reflection on various aspects

[1] *T.H.Andersen*
trine.andersem@ntnu.no

of the learning design and the possibilities of the spaces used. This workshop is an opportunity for such reflection.

In this workshop, we will explore different aspects related to designing learning experiences for traditional and student-centred learning spaces. These experiences can range from highly teacher-controlled activities to approaches where students are in 'control' and make decisions about which activities to complete and how to manage them.

Participants of the workshop will engage in various activities to get a better understanding of the challenges that teachers face when developing and orchestrating student-centred activities. They will have the opportunity to develop new ideas and perspectives on teaching and learning designs for various types of learning spaces and get insight into the scaffolding required to manage these activities. Participants will leave the workshop having reflected on their own teaching practice and with a better understanding of how to structure activities in various learning spaces.

1 BACKGROUND AND RATIONALE OF THE SESSION

Many universities have an increased interest in creating learning spaces that facilitate collaborative learning as research shows that student-centred approaches and peer interaction improve student learning (Freeman et al. 2014; Deslauriers et al. 2019). This is also in line with, for example, the CDIO initiative (CDIO 2024). Although spaces that are specifically designed for collaborative learning (UCISA Toolkit 2024) offer teachers many possibilities for student-centred learning experiences, teaching staff still need support and guidance when starting to use active learning spaces. During a previous workshop at the SEFI conference (Korpås et al. 2023) participants highlighted the need for well-described and clear objectives for learning activities. They advised against lecturing in this setting or to limit lecturing to short segments. It was emphasised that peer interaction as well as student-teacher interactions should be encouraged, while individual student work should be kept to a minimum. Participants also mentioned the need for a teacher-driven approach with a set pace and with frequent shifts between group work and plenary activities. However, activities can range from highly teacher-controlled learning activities to approaches where the students themselves are in ‘control’ and decide on which activities they will engage in and how they undertake them.

In a student-centred learning space, students are expected to collaborate, which is reflected in the layout of the space. What is common in almost all physical learning spaces are designated places for the students, and somewhere for the teacher to be based. The positioning of the teacher, furniture and technology will impact to what extent student-centred activities are promoted (Ellis and Goodyear 2016). When the teacher is positioned at the front, there is a tendency for more lecturing, as opposed to a student-centred learning space where the teacher is based to one side, or maybe does not have a designated position at all. In a student-centred learning space, it is easier for the students to have equal access to the teacher, compared to a traditional lecture hall where some students are closer to the teacher than others (Lejon et al. 2022).

In this workshop, we will explore the range of teaching and learning approaches in different types of learning spaces. Participants will exchange thoughts on why they as educators would choose a more teacher- or student-controlled approach and how this is affected by the learning space. They will discuss and reflect on: How to design and orchestrate the learning activities in these spaces? What scaffolding is needed? What challenges and opportunities do these approaches involve?

The workshop is a follow-up of a previous workshop held at the SEFI conference in 2023, which led to a collaboration between the organisers. The organisers regularly teach in student-centred learning spaces and have been using active learning approaches for many years. Additionally, they support colleagues with their transition to active learning approaches and have researched student experiences.

2 LEARNING OUTCOMES

During the workshop, the participants will:

- get a better understanding of the challenges involved when designing teaching and learning activities in different learning spaces.
- reflect on their own teaching practice.
- get insight into the scaffolding required to manage these activities.

3 WORKSHOP DESIGN

The participants will be allocated into small groups and the discussions will be facilitated by the workshop organisers. Images of three different learning spaces will be used as inspiration: a traditional lecture hall (figure 1), and two student-centred learning spaces, one with a clearly defined teacher zone (figure 2), and one without a well-defined spot for the teacher (figure 3).

Fig. 1. Lecture hall with a defined teacher zone

Fig. 2. Student-centred learning space with a defined teacher zone

Fig. 3. Student-centred learning space without a well-defined zone for the teacher

The workshop will consist of a series of activities:

Activity 1 (15 min): If you were to teach in these three spaces, where would you as a teacher be positioned? (The participants mark their typical positions using post-it notes to posters of different spaces, and the organisers facilitate a plenum discussion.)

Activity 2 (20 min): How do you plan the teaching and learning activities in these spaces? How will you approach it? What are the challenges? (The participants discuss in groups facilitated by the organisers and subsequently shared in a plenary discussion.)

Activity 3 (5 min): When you are planning your teaching and learning activities, are the students expected to be working at the same pace or not? (The participants mark their typical preference for each space on a scale.)

Activity 4 (20 min): What are the challenges and opportunities of having students working at the same pace or not? (The participants discuss in groups facilitated by the organisers and subsequently shared in a plenary discussion.)

4 RESULTS OF THE WORKSHOP

During the **first activity**, participants placed yellow sticky notes (Table 1) on posters of the different learning spaces to indicate where they would be positioned during teaching. From the pattern of pasted notes (see images Table 1) and the discussion that followed, it became clear that many participants used the lecture hall to its maximal potential, i.e. they would not only stand at the front of the room but walk up the aisles to interact with students or student groups. However, for the two student-centred learning spaces, participants could see themselves interacting much more easily with students and this at the same eye level, which they felt was more pleasant and less teacher-focused. In general, student-teacher interaction was highly valued.

In the **second activity,** the discussion expanded to how participants would approach teaching and learning in these different spaces and what the associated challenges and opportunities would be. In groups of four, participants wrote down their key thoughts on paper, which were collected at the end of the session. The main points raised by the groups have been summarised in Table 1.

Table 1. Key thoughts of participants on how they would plan teaching and learning activities in different types of learning spaces, and the opportunities and potential challenges associated with this.

		
Lecture hall	**Student-centred learning spaces**	
	defined teacher zone	**without a well-defined teacher zone**
• Delivery-focused • Technology is needed to 'upgrade' from just lecturing, e.g. polling • Peer discussion is possible in pairs	• Can alternate between transfer of information and exercises (group work) • Smaller project work in teams is possible • Teacher becomes a facilitator	• Allows for peer interaction and learning • Individual and group work possible • Booths available for quiet learning or consultation (the 'confession room')
+ Possibility to record the session + Can teach many students at once and keep an eye on everyone	+ Furniture can be moved around offering flexibility, students can work on tangible objects on the tables	+ Zones can be created for different activities and tasks + More flexibility in using the space

	+ Layout makes it easy to move around for everyone	
− Layout makes it difficult to move around for teacher and students	− Less control as a teacher	± Lack of teacher control

To broaden this discussion further, the **third and fourth activities** introduced the concept of ‘pace’. Participants indicated on a scale whether students would generally work at the same pace or at a different pace if they would teach in that particular space. This was followed by a discussion on the challenges and opportunities that this element of ‘pace’ can bring (Table 2), which participants wrote on paper. The participants found this a very interesting topic to discuss, and to reflect on in relation to their own teaching practice. When looking at the pink/orange sticky notes that participants placed on the scales (see images Table 1, ‘same pace’ on the left and ‘different pace’ on the right), student-centred learning spaces were felt as more supportive or conducive to having students working at a different pace, while the lecture hall is seen as being limited to students collectively going through activities at the same speed. In Table 2, we have captured the main thoughts that participants expressed about the aspect of pace.

Table 2. Key thoughts of participants on the opportunities and challenges that students working at the same pace or a different pace bring.

	Same pace	**Different pace**
Opportunities	• Easier to manage as a teacher • Video-capturing is possible • Peer interactions are stimulated • Whole group discussions are possible • Students might feel that they belong to a group • Steady progression, as the whole process is teacher-controlled	• Students can work at their own pace • Students can explore different topics • More time for the teacher to focus on students that need extra help • Faster students can support other students or work on extension tasks • Students are less frustrated
Challenges	• More challenging for students, more frustration • Student-student and student-teacher interactions are out of phase • There is waiting time for fast students (extra exercises needed) • Students who need a bit more time fail to complete the activities	• Difficult to manage, more challenging for the teacher because of individual paces • Students who work slower might feel that they are behind • Reliance on time management and self-regulation skills of students • Scaffolding needed for students • Loose progression

From the discussions during the workshop, it became clear that many participants were already educators who highly valued student-teacher and student-student interactions. Even in a lecture hall, that is not conducive to student-centred learning, they forced the teacher-focused space to work in such a way by introducing activities and using a teaching style that supports interaction. Although the type of space was not a barrier for the participants to use active learning approaches, the student-centred learning spaces opened up a range of teaching and learning possibilities not easily feasible in classical lecture halls. Participants highlighted that student-centred learning spaces promote group work and peer learning, offer easy access to students and teacher and are not only flexible in terms of layout and infrastructure but also in terms of the learning design, for example, groups of students can work on different activities at a different pace. The latter seemed most encouraged in a learning space that lacked a well-defined teacher zone. Nevertheless, teaching and learning activities that run in these student-centred spaces require some thought in terms of planning and management and often a bit of courage to give students a bit more control in their learning process.

ACKNOWLEDGEMENTS

We would like to thank all participants for their enthusiasm and interesting insights and contributions during the workshop.

ABSTRACT

This workshop was designed to be an open space to share and discuss possibilities to act for fundamental, perhaps radical, change in engineering education – towards an education that not only fosters technological excellence, but also contributes to fundamentally transforming society towards more sustainable ways of living. Our aim was to engage the participants in collaborative learning and co-creation activities to develop new knowledge, agency, and networks for educational change. To stimulate discussions, we first introduced two approaches for driving transformation: humor and activism. Then we introduced the "yes and"-technique which has previously been successfully applied for organizational development in higher education. Six groups with five to six participants applied this technique during the workshop. The 'yes and'-technique engaged the groups significantly and participants reported that they were surprised at how difficult it was to avoid the words "no", "not", and "but. We co-developed a list of action points that we can use to contribute to transforming

[1] *M. Berge*

engineering education where several action points were inspired by activism and/or humour.

1 INTRODUCTION

Most engineers, engineering educators, and engineering education researchers have chosen their professional path out of a desire to contribute to a positive development of society. Indeed, science and technology have contributed to tremendous improvements of human lives, but this development has also led to negative effects that have been argued to threaten our very existence on this planet. We are living in what is now frequently referred to as the Anthropocene, with humans affecting the planetary system to the extent that it becomes increasingly unstable. For example, our continued emission of greenhouse gasses impacts global climate systems and already today contributes to devastating forest fires, floods, and storms. According to Stoddard et al. (2021), exaggerated techno-optimism – or techno-solutionism – presents a fundamental barrier to climate mitigation. Still, science and engineering education tend to reproduce techno-optimism, rather than critically analyzing what technology we develop, why, and for whom (Ottemo et al. 2020). Engineering students are encouraged to focus on narrow, technical problem-solving (Peters 2018). Ethical concerns, for example, are constructed as something 'other' and less important than technical concerns (Lönngren 2021). For engineering education to remain relevant in the Anthropocene, it must move away from such narrow understandings of engineering and broader societal perspectives must be strengthened. Engineering education can and must contribute to fundamentally transforming all aspects of society towards more sustainable ways of living (IPCC 2018), but efforts for sustainability in engineering education are still mostly limited to minor changes, e.g., adding isolated sustainability modules (Kolmos, Hadgraft & Holgaard 2016). These efforts are also often underpinned by dominant neoliberal ideologies that tend to worsen rather than ameliorate sustainability issues (Gutierrez-Bucheli, Kidman & Reid 2022).

2 A WORKSHOP FOR CHANGE

In this workshop, we discussed the role of education researchers and educational developers in fundamentally transforming engineering education. We directed this workshop to participants who are already aware of the sustainability challenges as well as the need for fundamental change and who ask "What more can I do?". For example, some participants may already have tried to critique current engineering education or develop transformative education, but experienced challenges and resistance. Our aim was to provide an open space to share and discuss possibilities to more effectively drive fundamental, perhaps radical, change in engineering education. We asked the participants:

1. How can we support university teachers who wish to develop their education to contribute to societal transformation?
2. How could we promote change through research to challenge dominant norms and practices?
3. How can we collaborate with other actors (e.g., students, industry leaders, activists) to accelerate change in engineering education?

4. How can we support each other in our diverse struggles for change?

While primarily focusing on engineering education, we also allowed the discussions to move towards broader issues relating to education and engineering. For example, education is said to have been instrumentalized as a tool to promote economic growth (i.e. maintain the status quo; Sterling 2017) rather than leverage knowledge, creativity, and community for societal change. Exploring the role of engineering education for change therefore needs to be seen in the larger context of education, informed by research on education for sustainable development, ESD[2].

ESD research has shown that educators' professional development is important for promoting ESD and catalyzing change in higher education (Mulà et al. 2017). However, few European institutions have implemented significant staff development programs to enhance educators' ESD competences and leadership capabilities (ibid.). Other studies have shown that educators who have completed staff development programs may not be able to leverage what they have learnt for actually transforming education (Elmberger et al. 2023), often because they lack a supportive community. In this workshop, we therefore emphasize collaborative learning, co-creation, and community building. As a starting point for the discussions, we introduce two possible approaches to driving transformation: humor and activism.

3 TWO POSSIBLE APPROACHES: HUMOR AND ACTIVISM

We presented two approaches for change. Our first approach was humor. For several reasons, humor is a powerful tool for addressing societal challenges, such as climate disaster and extreme hunger. Humor concerning our society is often critical; it attacks those in power, and it highlights faults and deficiencies in the political system (Billig 2005). Political humor assumes, and is built on, that the audience have feelings for politics – frustration, joy, hope, enthusiasm, anger, resignation, and so on (Doona 2022). Comic mediations of politics are therefore strongly effective for describing political reality since these are working 'from and upon emotional patterns' (Corner et al. 2013, p.32). For example, Randall Munroe, use both humor and science to explain our climate change in his webcomic xkcd (2024):

[2] Also termed environmental and sustainability education (ESE).

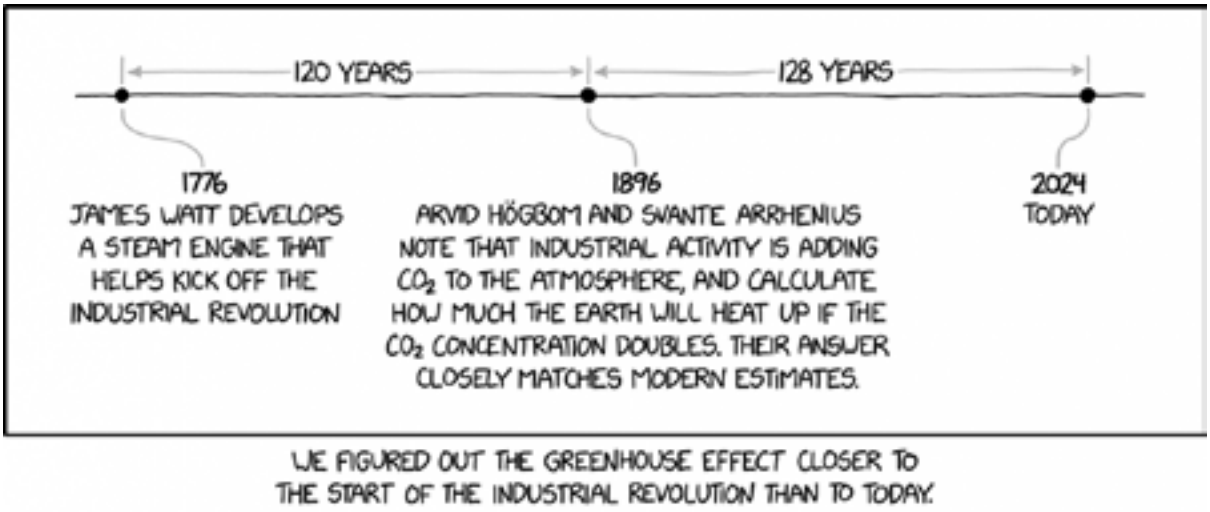

Fig. 1. Randall Munroe portrays when scientist started to talk about climate change

Munroe is using absurd facts to make us laugh, to understand the world around us, but also to feel frustration. Humor may also create a distance to the topic (Cohn 1987); Cohn noted how the participants in a center for defense technology and arms humorously talked about missiles without touching on the realities of nuclear holocaust that lay behind the words. For instance, the MX missile was called ‘the Peacekeeper’ and the bombs dropped over Hiroshima and Nagasaki were called ‘Little Boy’ and ‘Fat Man’. This humoristic language distanced the people working with nuclear weapons from the disastrous impact those weapons can have if they are deployed. The power of humor is connected to patterns of in-/exclusion: Those who understand a joke are brought together, while others are shut out. In other words, humor is both ‘social and anti-social in that it can both forge social bonds and exclude’ (Billig 2005, p. 176). Jokes challenge the taken-for-granted and often deal with taboos and moral boundaries, they provide useful tools for discerning hidden norms (Kobayashi & Berge 2022) and facilitating critical discussions about how we should live our lives. In this workshop, we challenged participants to reflect on the ways in which they consciously or unconsciously use humor when they teach, for example through webcomics or stimulating laughter. What norms are challenged or reproduced through their use of humor? How may the humor participants use contribute to in-/exclusion in the classroom and (dis-)engagement with societal aspects of engineering? And how do/could they use laughter intentionally to diffuse tensions in social interaction, facilitate perspective shifts, and open new possibilities of (inter)action?

Our second approach for change was activism. Following decades of discussions on normativity in ESD (e.g. Kopnina 2015; Tryggvason et al. 2023), we are left wondering whether/how we can reconcile non-prescriptive education with the pressing need for fundamental, radical change for sustainability. Some research has argued for playful and creative approaches to educating students for radically different futures (Barrineau et al. 2022). However, do these approaches remain helpful as the urgency for change increases? Can we still rely on the power of conversations around ‘matters of concern’ (Latour 2004) and openness in educational encounters (Barrineau et al. 2022) or do we need more powerful interventions? Other research focuses on such interventions, suggesting that activism is one of the most effective tools for achieving (radical) change (Sutoris 2022). So far, however, activism seems somewhat taboo in academic contexts and engaging in it may have negative consequences for one's career, health, and safety. Activism may also further increase polarization in academia and the wider society, which we see in the ongoing pro-Palestinian activism on and around university campuses. While we find it important to consider possible risks, we also want to highlight that activism can be done in many different ways. We see that it can be open, playful, co-creative, and peaceful. In this workshop, we discussed the (in)acceptability and (in)effectiveness of potential activist approaches for transforming engineering education. We also reflected on whether/how we could see ourselves engaging in activism or supporting others to do so. Finally, if we do use activism, do we perhaps also limit the possibilities of a peaceful and democratic future in and through education? How can we drive change while paying attention to relationality and emotional engagement with each other and the world?

4 WORKSHOP DESIGN

The workshop was mainly based on a brainstorming tool called the 'yes and'-technique, which has previously been successfully applied for organizational development in higher education (Rossing & Hoffmann-Longtin 2016). In this approach, saying "yes and" means that we accept any ideas and suggestions offered by other participants, rather than blocking or rejecting ideas (ibid.). Thus, we can postpone premature judgement based on taken-for-granted norms and creatively explore alternative ways of being and acting for change. The workshop was structured as follows:

1. We introduced research on the need for profound societal and educational change and humor and activism as two possible approaches. (5-10 min)
2. Participants briefly discussed challenges and opportunities associated with the two approaches and, more broadly, 'What more can I do?'. (10 min)
3. We introduced the 'yes and'- technique (5 min).
4. In small groups, participants used the 'yes and'- technique to collaboratively explore and co-create unexpected possibilities for change. (20-25 min)
5. Participants shared their most important insights in plenum, and we discussed possible ways forward (10 min).

5 OUTCOMES

The 'yes and'-technique engaged the groups significantly, and the sound volume became very high. Participants reported that they were surprised at how difficult it was to avoid the words "no", "not", and "but." Once they got used to it, however, they found the 'yes and'-technique useful for co-creating ideas together, focusing on opportunities instead of obstacles, and creating trust in their small groups. Interestingly, we saw a clear geographic divide: many participants from North America were very familiar with the 'yes and'-technique and even reported using it with their students in their own teaching. Many participants from Europe, on the other hand, said that it was a new experience for them. One participant from South Africa also shared that they regularly and successfully use this technique to obtain buy-in for institutional change.

While the workshop was too short to develop participants' 'agency for change' in real time, we co-developed a list of action points that we could use to contribute to transforming engineering education (see Figure 2). Several of the action points were inspired by activism and/or humour. For example, one group suggested organizing a stand-up comedy festival or post comedy strips on sustainability to raise awareness and create engagement. Another group suggested that we need senior academics as activist role models – to show that activism is something one can engage in in academia and inspire others to follow. After the workshop, we posted the list of action points at the entrance of the conference building, where all conference participants pass by.

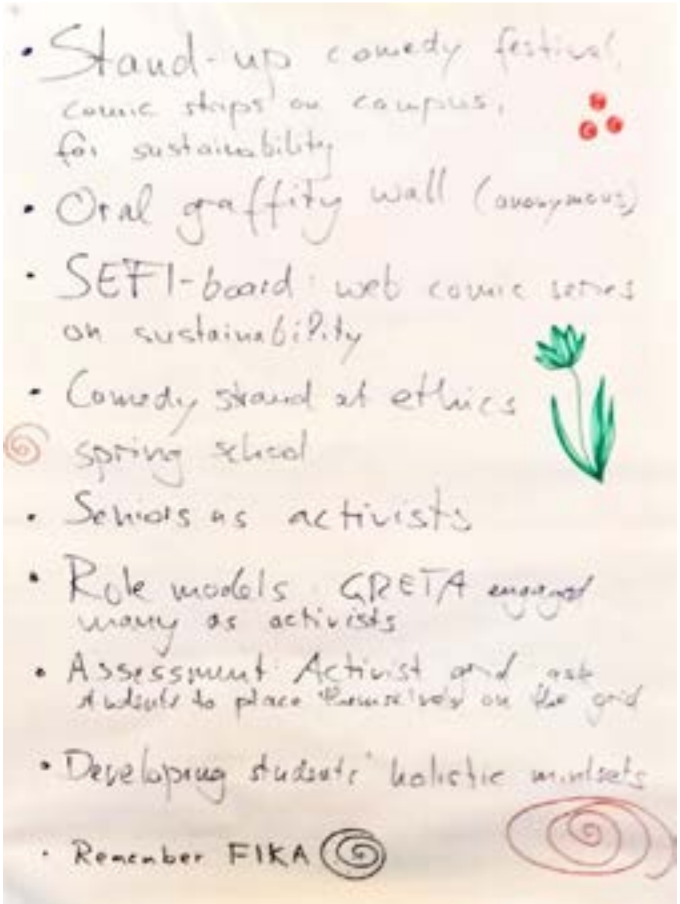

Fig. 2. Co-developed a list of action points

One participant sent us an email a week later, writing that the workshop made him think about pedagogical applications. He envisioned an engineering education practice in which he would ask the students to identify something they would like to change. He also planned to teach students about historical change processes in which technological development, scientific discoveries, social relations, and activism interacted. We feel inspired by this suggestion, and we envision that engineering students, based on lessons learned from historical examples, could use the 'yes and'-technique to identify ways of recreating similar change processes for the future.

1. MOTIVATION AND LEARNING OUTCOMES

[1]B.Bergman
becky@chalmers.se

A key aspect of social sustainability is diversity, equity and inclusion (DEI) and many European universities have their own DEI policies (Direito et al. 2021). To implement these policies within the classroom setting, teacher professional development (PD) is crucial. However, few universities do this in a systematic way. Within an engineering education context, this topic has received much attention as programs strive for a more diverse and inclusive environment, in an increasingly polarized environment. The SEFI position paper on DEI encourages in-depth and ongoing training for staff in this area that includes practical approaches to bias management. This workshop aims to provide a platform for teachers, teacher trainers, policy advisors and researchers in teacher professional development in engineering education to consider professional development practices in DEI in their own contexts.

The aim of this workshop was to:

-showcase examples of how professional development in DEI is carried out in several European technical universities in response to both institutional and national policies

-reflect on professional development and the DEI needs in different contexts, linking policies, theory and practice

-share good practice from participants' different contexts

2. BACKGROUND AND RATIONALE

Within engineering education, DEI policies can vary considerably where gender features strongly, but also contain aspects such as special needs, socioeconomic background, international diversity and ethnicity (Direito et al. 2021; Van Maele et al. 2023).

While there is some evidence that PD is increasing in general in higher education (Gaebel and Zhang 2018), PD of DEI remains a neglected area. However, in order to implement DEI policies within the classroom setting, teacher PD is crucial. For instance, as regards the international classroom, recent studies have highlighted the need for PD within the international classroom (cf. Coryell and Salcedo 2021; Renfors 2019; Zou et al. 2020). While teachers have sometimes been portrayed as "blockers" in implementing international strategies (Beelen 2018), other research has portrayed their critical role in making internationalisation happen (Van den Hende et al. 2023).

This workshop explores the DEI policies and implementation of them in PD at three universities in Europe: Chalmers University of Technology in Sweden, TU Eindhoven in the Netherlands and KU Leuven in Belgium. The approach in each of these countries differs; for instance, in Sweden the tendency is towards regulation whereas the Dutch depend on collective agreement. These examples will be used as inspiration for discussions of other countries and contexts in empowering teachers in the diverse classroom.

In Sweden, there are recommendations for higher education (HE) pedagogy by the Association of Swedish Higher Education Institutions (SUHF) (https://suhf.se/publikationer/rekommendationer/) where DEI is mentioned as follows: Educators should "reflect on their professional approach to academic teaching and their relationship with the students, and also towards the fundamental values of higher education, such as democracy, internationalisation, gender equality, equal opportunities and sustainability" and "interact with students in an inclusive manner and demonstrate knowledge of rules and regulations regarding students with disabilities and of available student support."

At Chalmers University of Technology, these goals have been put into practice with a compulsory course for all examiners, led by one of the presenters, where DEI is realised through a focus on gender equality, the international classroom and special needs.

In the Netherlands, the Ministry of Education published a National Action Plan on Diversity and Inclusion for Higher Education and Research in 2020, delineating an integral approach to enhance diversity and inclusion (https://open.overheid.nl/documenten/ronl-3d4db279-2786-44c8-a1af-5337604eebfd/pdf). This includes creating awareness and knowledge of DEI at institutions for Higher Education. Most Dutch Universities have a Diversity Officer, whose purpose is to stimulate and advise on matters related to DEI, and they exchange their experiences in a national meeting.

At TU Eindhoven , DEI is one of the strategic priorities of the Executive Board, with the focus, like at Chalmers, mainly on gender equality, the international classroom and students with special needs. In PD, DEI in education is included in the University Teaching Qualification (UTQ), particularly topics related to the international classroom. In addition, (non-compulsory) training on Inclusive Interaction and Education is available as part of the PD offering.

In Flanders, Belgium, all employers from all sectors must provide professionalisation opportunities for their employees. Within HE, DEI is seen as part of both lifelong learning objectives and social policies affecting students and staff. There are no central requirements, but most Flemish institutions have diversity policy officers who coordinate and align work on DEI topics in HR, student services, research and education. Exchange across institutions is organised by the Flemish Interuniversity Council working group Diversity and Social Policy.

At KU Leuven, DEI is a transversal theme in the strategic policy plan and gender equality plan. The onboarding programme for new teaching staff includes a two-hour module on DEI with a focus on the commitments stipulated in the institution's Charter for Inclusion. In addition, (non-compulsory) in-person and online trainings are available to all staff regarding bias in recruitment and selection, diversity responsive education, inclusive communication, and social safety & bystander intervention. The central Diversity Policy Office also supports faculties in creating on-demand DEI trainings.

3. WORKSHOP DESIGN

The workshop was designed with three parts:

(1) setting the scene through examples of professional development within three engineering universities in response to DEI policy

(2) brainstorming possible ways to deliver PD in DEI given different contextual affordances / constraints

(3) sharing best practices

3.1 Part 1 (15 mins): setting the scene

The facilitators provided a snapshot of PD within DEI from their home universities. Amongst the facilitators, one runs PD for DEI, another works with policy making and others work with engineering education and diversity research. We used this combined expertise to give an overview of the process from different perspectives from interpretation of policy to designing course interventions to delivering these interventions.

3.2 Part 2 (25 mins): mapping policy to practice

The participants worked in small groups of 3-4 with people from different backgrounds, for example, different roles at their institutions. They mapped the current situation for PD in DEI, using a step-by-step approach, starting with their own institutions' DEI policies and strategies, moving onto actual or potential PD and reflect on how PD meets these needs, using an adaptation of the 5E model of environmental engagement (Macharis and Kerret 2019). This model uses the key words of Estimate, Engage, Educate, Enable and Encourage to set goals, explore potential paths for achieving the goals and enabling achievement of those goals. We chose the steps of this model as means to describe the link between policy and practice.

This process used some guiding questions reflecting the model:

1. **Estimate**: What are the institutional policies regarding DEI?
2. **Engage**: How are or how could these policies be implemented as regards PD in DEI right now?
3. **Educate**: If there is teacher PD in DEI,
    a. which elements are focused on in the training?
    b. how is the training organized?
    c. who participates in the training?
    d. If not, how could this be organized according to the above questions?
4. **Enable**: How is it made possible for teachers to follow the PD?
5. **Encourage**: What is the incentive for participants to participate?

Each group created its own poster around the topic using a given poster template.

3.3 Part 3 (20 mins): sharing good practice through a poster presentation

Each group displayed their poster and there was an opportunity for a poster mingle and to ask questions. This allowed participants to gain insights on approaches at other institutions.

4. RESULTS

The workshop was attended by participants from 7 different countries (6 within Europe and 1 outside) and 9 different institutions. When presenting the results, it is important to note that these were the impressions of the participants and not necessarily representative of the country as a whole or even the institution. The results are given according to the 5E model, focusing on certain key words.

4.1 Estimate (policies)

Most participants could identify policies concerning DEI at their own institutions, though it was felt that at some institutions, they were more explicit than at others. For example, in the UK, the Equalities Act of 2010 was felt to have made an impact on explicit demands as regards DEI at university level whereas in Denmark, it was felt to be more implicit with a focus on student well-being and inclusivity. Some recognized a focus on gender within engineering education whereas others felt that the policies were more generally formed, talking about DEI capabilities and working against racism and sexism.

4.2 Engage

This section was least developed by participants, possibly because as teachers, it might have been more difficult for them to answer. It is also an area which is generally challenging for institutions in general.

4.2 Educate (PD)

As regards the PD provided for teachers, two clear scales could be identified: 1) compulsory vs optional and 2) online vs on campus delivery. In terms of the first point, there was often compulsory PD to fulfil national criteria, especially for new employees at the institution, and this training often included some element of DEI, though this might be rather perfunctory. In addition, there was the possibility at some institutions to do further training in DEI, sometimes provided online, which was encouraged but not mandatory.

4.3 Enable

Aside from the PD offered (both compulsory and optional), some institutions offered grants for gender equality projects or other DEI projects. Some institutions also offered awards for staff who engaged in DEI. At one institution, a specific DEI community of teachers was in the early stages of development as well as activities such as Diversity Week to create awareness. One issue that emerged was that of accessibility for all involved in teaching, for example in one example, PhD students did not have access to all PD resources, though they were involved in teaching themselves.

4.4 Encourage

It seemed that with more explicit national demands on DEI in higher education (e.g. UK, Sweden), DEI training was needed for promotion within the institution and hours provided (at least in theory) for that training. Otherwise, training was available for staff who were motivated and interested in taking part and encouragement came more from bottom-up initiatives and peer pressure. Several participants stated the need for recognising this training more formally as well.

5. CONCLUSION

To some extent, our expectations were confirmed in this workshop in the sense that while institutions seem to have DEI policies, varied approaches are taken to implementing this in PD for teachers. In countries with national DEI policies, there seemed to be a more systematic way of implementing this in the institutions, with explicit demands for PD in DEI and paths to promotion connected to this, in other words, a more top-down approach. Otherwise, a more bottom-up approach was preferred through offering training, communities of practice, DEI activities and incentives to take part in these activities and combinations of these two approaches.

In terms of interpreting DEI, our discussions revealed differences as well. For example, when discussing diversity, different approaches can be identified, where some institutions place more emphasis on particular aspects such as gender, while other institutions seem to focus more on inclusion aspects through student well-being for example. However, it was discussed that a focus on inclusion alone risks underestimating the complexity of differences within the student group.

Based on the input given during the workshop, we conclude that a combination of more top-down and more bottom-up approaches, with attention for both the more explicit and implicit aspects of diversity is likely most effective. We expect that by combining and aligning these different approaches a more effective translation from policy to practice will be possible, which will enable institutions to reach a broader group. It would be interesting to investigate further how such a combined approach could take shape.

ABSTRACT

This interactive workshop, facilitated by a team of editors, associate editors and experienced reviewers from a number of leading journals in engineering education, allowed participants the opportunity to network with other researchers and to learn about the journal publication process and how best to navigate it as an author.

It provided an informal opportunity for both early-stage scholars, as well as those with more experience, to share their publication journeys and experiences, both positive and negative, directly with each other and journal editors.

1 INTRODUCTION

The process involved in getting an article published in any academic journal can be difficult to navigate. Within Engineering Education Research (EER), the publication journey can be particularly complex and challenging, in part, as a result of its interdisciplinary nature, meaning that researchers draw upon theories and methods from multiple domains and thus face challenges associated with differences in disciplinary paradigms, terminology, publishing traditions, and norms. The diversity in the research approaches also means that there is a wide range of journals available to those looking to publish their work, each having its own distinct scope. Specific journals may, therefore, focus more on scholarship of teaching and learning (SoTL) as opposed to theory development. They may be aimed at a general education audience, rather than specially at engineering education practitioners and researchers, or their focus may be on quantitative over qualitative studies. Such variation can leave authors wondering exactly what editors and reviewers seek, how to focus their manuscripts, and how to expand conference papers to a level acceptable for journal publication.

Understanding the requirements and appropriateness of each journal can help save time for all involved in the process. It can also help make the experience constructive and meaningful in terms of researcher development and is likely to lead to more impactful publications of higher quality.

Although journals put significant effort into disseminating their scope, it can be challenging to interpret. To help researchers develop a better understanding of the process and landscape, this workshop provided an overview of the academic publishing process to make this process transparent and attainable. This took place through a facilitated discussion that stimulated reflection, allowing everyone the opportunity to share their experiences and help foster a supportive community of authors with a better understanding of the journals' processes.

2 WORKSHOP DESIGN

Understanding the requirements and appropriateness of each journal can help save time for all involved in the process. It can also help make the experience constructive and meaningful in terms of researcher development and is likely to lead to more impactful publications of higher quality.

The workshop mainly attracted authors with little or no experience in publishing in EER Journals. The workshop attracted around 50 participants who worked in groups of 4 or 5, with 10 Editors/Associated Editors distributed across the groups facilitating conversations regarding participants' questions and concerns related to the publishing process.

The Engineering Education Research journals represented included:

- European Journal of Engineering Education (SEFI)
- Journal of Engineering Education (ASEE)
- IEEE Transactions on Engineering (IEEE)
- Australasian Journal of Engineering Education (AAEE)
- Studies in Engineering Education (SEE)

A key part of this process was to introduce participants to the people behind the journals' decision-making in an attempt to bring a human side to what can seem a remote and abstract process.

2.1 Workshop Outline

The workshop agenda was designed to promote engagement and interaction between the participants and the workshop leads.

- 10 Minutes - Welcome and Introductions – Getting to know each other (facilitators and participants).
- 10 Minutes - Think-Pair-Share/Quickfire Discussion – What is your experience of authoring EER journal papers? What would you like to know (or would have liked to know) as a new author? What is the most daunting aspect of authoring?
    - Collating "what you would like to know" and "what is most daunting" to seed discussion in the next activity.
- 20 Minutes - Group Discussion with each group facilitated by an editor (one of the workshop leads) - Strategies for authoring (focused on the outcomes of the initial group discussion regarding daunting aspects of authoring).
    - Break-out groups collaborate on an online shared document to collate and distil workshop discussions and insights.
- 10 Minutes - Synthesis – Discussion of results from each group.
- 10 Minutes – Wrap-Up and Top Tips from the Editorial Teams.

Through these dialogues, participants co-created an enhanced understanding of strategies for success in academic publishing that formed the basis of the final workshop output.

2.2 Workshop Outputs

The final plenary session of the workshop collected a number of key questions and concerns of participants and drew enlightening responses from the editors present. These included:

- How to deal with conflicting feedback between reviewers?: Ideally, if this happens the editor or associate editor should provide guidance, however, if there are concerns the team suggested reaching out the editor for support. Authors were advised to address this specifically in their response to the reviewers and to highlight how they navigated this conflict.
- Can you push back on reviewers' comments?: The general response was yes, but with well-justified answers. The editorial teams reminded authors that the reviewers are advisors in the process. Ultimately the editor is the one with who makes the final decision.
- Concerns over appropriate methodologies: It is important to demonstrate an understanding of the context of the methodologies proposed in your work and, in particular, how they are usually applied in EER. It was suggested to "find your tribe", get in touch with seniors in the field, ask them for feedback on drafts, abstracts, etc. Make sure you tell the story of your work and be clear on the reasoning of the choices. It was noted that mixed and qualitative

methods are increasingly accepted in EER but you must ensure that you ground your research in theory.

- It was asked, ‘How can we show an intervention is actually working if we can’t do a full double-blind trial with the class?’ There is no one answer, but evidence should go beyond student self-report data (student surveys). Care should also be taken in using assessment results—while we aim for comparability of assessment between years, this is not always done with the rigour we would expect of a research tool.
- Choosing a journal: The emergence of ‘predatory’ journals was discussed. It was highlighted that many of the key journals (and those represented at this session) were linked to engineering education societies, such as SEFI, and that this promotes a higher level of confidence in the quality of the publication. For more information on journals within the Engineering Education Research space, authors were encouraged to see the Journals page of the Research in Engineering Education Network (https://reen.co/eer-journals/), which gives a non-exhaustive list of key journals.

Prospective authors were encouraged to engage with reviewing in journals to get a better understanding of the process. For example, many journals will give potential reviewers the chance to sign up for reviewer programme (e.g. JEE - tinyurl.com/ReviewForJEE).

SUMMARY AND ACKNOWLEDGEMENTS

The authors would like to thank all those who participated in the workshop and to the organisers of the 2023 edition of this workshop in Dublin for the inputs and feedback which have strengthened this year’s version.

Conference Key Areas: *Engineering ethics education, Teaching social and human sciences to engineering and science students*
Keywords: *Ethics Education*

ABSTRACT

The importance of ethics education within the engineering curriculum cannot be overstated. As such, it has received considerable emphasis in progressive engineering education curricula worldwide. However, it has been noted that many of the examples used relate to generic issues in engineering, for example, failure to follow codes of ethics, rather than issues that are related specifically to engineering disciplines. We argue that while these generic issues are important, it is vital that discipline specific examples are also available for educators to embed ethics issues and concerns within technical classes.

As part of the development of the Routledge International Handbook of Engineering Ethics Education (Chance et al., forthcoming), the authors represented here have developed a series of chapters to highlight ethics issues and discussions that are

[1] *John E. Mitchell*
j.mitchell@ucl.ac.uk

pertinent to Chemical Engineering, Civil Engineering, Electronic and Electrical Engineering, Mechanical and Aerospace Engineering and Software Engineering.

In this workshop we engaged educators in an exploration of the ways that discipline specific ethical topics may be embedded in the technical subjects within their discipline. The workshop aimed to support those that are looking to make sure of the handbook to enhance their coverage of ethics within their teaching and will help promote the open-access publication within the engineering education community.

1 MOTIVATION & LEARNING OUTCOMES

The teaching of ethics has received increased attention and focus in engineering curricula around the world, driven by both accreditation requirements (D. A. Martin et al., 2021a) and educators' desires to create well-rounded engineering graduates with a sense of global responsibilities. The aim of this workshop is to encourage other educators in engineering to engage with a process of interrogating their technical curriculum to look for opportunities to incorporate ethical content into their teaching.

Technical subjects such as engineering often view themselves as morally neutral (Roeser, 2012) a position often adopted by big tech companies in defence of any unsavoury act that may have involved their technologies or their platforms. As demonstrated by Martin et al. (2021b) this position has been challenged and is changing, albeit slowly. As they also point out, there are significant challenges to implement ethics in the curriculum and coverage is still patchy. It is also often within the context of codes of conduct rather than in addressing ethical design as a fundamental tenet of the engineering design process (Stappenbelt, 2013).

In the field of civil engineering, education has traditionally focused on aspects related to the design, construction, operation and end of use of infrastructure projects from a technological perspective. However, important issues such as professionalism, social responsibility or decolonisation have seldom been introduced in the civil engineering curricula (Josa, Giménez, Nick, forthcoming).

Educators in the field of software engineering have traditionally emphasized the importance of technical proficiency in coding, algorithms, and systems design. However, the rapid integration of computing in society, and the emergence of 'Big Data' has given rise to significant ethical concerns pertaining to algorithmic bias, dark patterns, and privacy invasion. As a result, educators have begun to prioritize ethical considerations within the discipline, laying particular focus on the interlinked lifecycles of software development and data management. Using dialogue approaches and reflection tools aligned with real-world software engineering practice, educators can help students cultivate a deeper understanding of the ethical dimensions and societal impacts of their work (Lunn, Hazewindus, Prasad, and Ramachandran, forthcoming).

In electrical and electronic engineering (E&EE), educators have begun to integrate ethics into technical classes such as Introduction to Circuits and Controls. Opportunities also exist to explore integrating topics such as electromagnetics and health, "right to repair," image technology and privacy, and implications of wireless systems. Further, instructors may consider discussing problematic aspects of E&EE culture such as resistor codes, racist and/or sexist terminology, and the "Lena" image (Lord and Mitchell, forthcoming).

Chemical engineering (ChE) deals with chemicals while other branches of engineering do not. This fact needs to be reflected in ethics teaching for ChE students. Chemical engineers design, manufacture or apply new materials and products, come up with innovative processes to use and transform energy, or work with microorganisms, food, pharmaceuticals, and fuels. These materials, their conversion or transformation products, or their waste products, impact people, society, and the environment. Given the large scale of industrial processes in which ChE expertise is employed, these impacts can potentially be disastrous. Thus, an increased responsibility for overseeing and controlling the impacts of the material output of professional work may be formulated for ChE (Mehlich, Børsen and Kim, forthcoming).

Lastly, the chapter on ethics in aerospace and mechanical engineering argues that ethics education must engage mechanical and aerospace engineering students in deeper conversation to critically analyse the sociotechnical impacts of their fields and develop the critical consciousness (Freire, 1970) necessary to build toward social justice. While there are many microethical topics in the field that address the individual responsibilities of engineers, typically forgotten in engineering are macroethics, the collective social responsibility of the field. For example, macroethical topics relevant to aerospace and mechanical engineering include the military-industrial complex, a lucrative endeavour that benefits governments and defence companies in the Global North at the expense of people and communities in the Global South; automation, which changes labour in ways that widen existing societal power gaps; sustainability efforts, which should consider the existence and purpose of system in addition to the technical functions; and humanitarian engineering, which must empower poor and oppressed people to best determine what sociotechnical solutions will best serve their communities (Johnson, Bowen, Cruz and Rodrigues, forthcoming).

2 IMPORTANCE OF ETHICS IN ENGINEERING EDUCATION

Engineers will design new technologies that have an impact on the world and will therefore have the potential to create new ethical dilemmas. For example, autonomous vehicles (Martinho et al., 2021) and algorithms (Benjamin, 2019; Noble, 2018) are excellent contemporary examples of how real-world and current topics can be used to engage students in the discussion of ethical topics directly related to elements of their technical studies or their design projects.

As students, industry, and accreditation bodies place increased emphasis on global responsibility and the ability for their students to act ethically in the workplace, there is a pressing need for educators to be supported in embedding and integrating the study of ethics and ethical considerations within their disciplinary studies. The workshop attracted educators from a range of disciples with an interest in how they might include discussion of ethical issues at various points within the curriculum in ways that are meaningful for today's students.

3 WORKSHOP OUTLINE:

The workshop will began with short presentations from the 5 disciplinary groups represented:

- Chemical Engineering
- Civil Engineering
- Electronic and Electrical Engineering
- Mechanical and Aerospace Engineering
- Software Engineering

Each gave a short overview of some of the specific ethics challenges that may be explored within the engineering discipline. The workshop then broke into discipline specific working groups to consider the topics that have been discussed and identify areas of their curriculum in which they might be useful and to share any additional topics that they have experienced within their disciplines. These were reported back to the group by each table and collected by the facilitation team.

4 WORKSHOP OUTCOMES:

The two authors of the Electronic and Electrical Engineering (E&EE) facilitated a discussion of those interested in E&EE as well as Mechanical Engineering since the authors of the ME chapter were not able to attend. A variety of topics were discussed including the importance of tying the ethics to the technical content of disciplinary courses so it is seen as “real-world” engineering rather than something extra thereby enhancing student acceptance and reducing resistance. We discussed the challenges of doing this work in large classes and risks of doing this work for the instructor, particularly considering their position in their career. We discussed the importance of and difficulties of working with communities to integrate ethics authentically Attendees were interested in seeing the chapters in the handbook once it is published.

Five workshop participants with affiliations to ChE and Civil Engineering joint one shared table and exchanged experiences with teaching ethics to these segments of engineering. We first agreed to exchange material between the participants by referencing relevant work in this paper. Thus, we shared material on ChE (Schummer and Børsen 2021, 2020, Eckerman and Børsen 2018, Børsen and Nielsen 2027) and civil engineering (Engineering Professors Council n.d., Josa and Real 2023, Engineers without Borders UK 2023, Pérez Foguet n.d.).

The people gathered around the table agreed that a disciplinary approach to engineering ethics education is important and that it must be based on ethical issues in the specific discipline. They also emphasized the importance of having a concept or an approach to structure and compare the different disciplinary-based ethical issues. In the chapter on ethical issues in ChE the issues are structured around different forms of responsibility. In the chapter on civil engineering the structuring factor is the life cycle of civil engineering projects that ethical issues in civil engineering is centered around. Other approaches to structuring ethical issues are possible, for example are the different ethical issues of ChE in the “Ethics of Chemistry” (Schummer and Børsen, 2021) gathered around a classification of the issues as good intentions, possible misuse, adverse effects, long term consequences for culture, society and the environment.

During the workshop, approximately eight participants converged to discuss approaches for incorporating ethics in pedagogy into computing fields. The conversation explored the complexity of ethical considerations for technology, especially in light of challenges in software engineering and the rapid evolution of the tech landscape. Participants agreed that ethics, though not always widely addressed, is crucial as technology continues to advance.

A significant challenge raised was the concept of the end of life in software and devices. This included not just the technical transition when programs or devices are no longer supported, but also the ethical implications of incentivizing consumers to continuously buy newer and newer devices. The practice, though commercially driven, contributes to a "convenience culture" that results in increased carbon footprints and environmental degradation. Moreover, the pressure for backwards compatibility can add to this tension, where older systems may struggle to integrate with newer ones, causing users to upgrade prematurely, which raises questions about the ethical sustainability of current software lifecycles.

One of the emerging points of discussion focused on the role of educators in fostering ethical awareness. Participants pondered the challenge of ensuring students recognize and anticipate ethical dilemmas within the software lifecycle, such as the need for responsible management of open-source software (e.g., handling DLL hells). This directly intersected with the need to address "wicked problems," issues that have no clear solutions but require careful deliberation. When monitoring underlying use changes, such as shifts in how users interact with technologies, educators could adopt an “ethics by design” approach. This method would incorporate ethical philosophies from the very beginning of the design process, ensuring that systems are built to serve users in responsible ways.

The group also discussed comparative assessments, such as the famous MIT Moral Machine experiment, which examined how different cultures respond to ethical dilemmas like the trolley problem. Participants reflected on whether engineers can draw lessons from these comparative studies to design systems that balance ethical concerns with practical utility, while factoring in the cultural context of the user. Overall, the group emphasized that our role as educators is to help future engineers develop the ethical awareness needed to navigate the multifaceted ethical challenges posed by technological advancement. Ethical considerations must not be an afterthought but an integral part of the design process, requiring collaboration, reflection, and a commitment to serve societal needs responsibly.

Teaching the knowledge, skills and attitudes of sustainable engineering
Keywords: *STEM education, Innovation, Sustainable Development, High School*

ABSTRACT

The aim of the workshop is to foster a synergetic collaboration between engineers / industry professionals and educators, teachers and students, with goal to address STEM education gaps related to the Sustainable Development Goals (SDGs). Engineers and science experts will be encouraged to reflect on the societal impact of their work and explore ways to transform this impact into inspirational educational content, in form of novel Open Education Resources (OERs) for high, middle and primary schools, which will enhance the accessibility and inclusiveness in sustainable development education. This collaborative co-creation approach has a potential to revitalise engineering education by fostering awareness about sustainability challenges, inspiring future generations, and equipping them with the knowledge to engineer the sustainable future.

1 INTRODUCTION

1.1 Background and Motivation

Lack of the interest of youth, especially girls, to engage in studies and careers in STEM (Science, Technology, Engineering, Mathematics) subjects, and in particular physics and engineering, is a contra-productive trend. Solutions for global challenges, innovations and technologies, which are needed for sustainable development and economic prosperity, heavily rely on expertise in science and research, but also future society leadership with transversal skills and ability to take fact-based decisions. Even if jobs in STEM grow 3 times faster than in other sectors, the lack of qualified workforce (especially engineers) is strongly felt by tech and physics-based industries already today.

To respond to this challenge, it is crucial to take an action and inspire young people (and girls in particular) to become part of the future pool of STEM specialists, already at early age [1]. This issue can be effectively solved only by shaping the science education at high- and even primary school level [2]. Such mission can be tackled only as a collaborative endeavor of multi-stakeholder community, including scientific, education, but also industrial actors.

The large positive impact of research – industry collaboration and physics - based industries on socio-economic progress, innovations and sustainable development (recently reported by EPS, SPS and SAWT [3,4]) is largely unknown, but very powerful to inspire youth and shape the attitude towards physics / science of general public. The avenue of such context-based science education is indeed efficient to increase the interest of students, especially girls, for STEM (as recently proven by studies [5] and projects [6,7,8]).

In the framework of the UNESCO International Year of Basic Sciences for Sustainable Development, the innovative international multistakeholder project Youth@STEM4SF (Youth at STEM for Sustainable Future) [7, 8] has been conceptualized among several European countries and successfully piloted in 2023 in Switzerland with encouraging results, in terms of inspiring high school students, especially girls for STEM careers by presenting science and engineering at work for society and sustainable development, through inspirational tech-industry providing the examples of concrete applications and technologies, interaction with role models of both genders and showcasing vast career opportunities (70% of scientific careers are in business and industry).

Education21 [9] (the Swiss federal authority for education on sustainable development) has chosen the project as a perfect example of pioneer program aligned with new Swiss education plans aiming for transversality and connection with sustainable development.

Within the UN International Decade of Sciences for Sustainable Development (2024-2033), the aim is to extend the scope and increase the impact of the Youth@STEM4SF project to develop the missing high school educational resources integrating sustainable development into science curricula. The first example developed is the Graasp Climate teaching tool offering the interactive modules on physics of climate change to high school teachers [10]. This is enabled thanks to the project ResponSE (Responsible STEM Education) [11] (to be specified at later stage) with goal to co-create such digital resources, using the Graasp [12] learning experience platform to design meaningful inquiry-based learning Open Educational Resources (OERs). The co-creation process will involve high-school students sensitized during the thematic day in the framework of Youth@STEM4SF project, their science teachers, digital education engineers and learning science specialists from EPFL-REACT group [13] / BeLEARN [14], and ideally engineers working on concrete innovative solutions for sustainability.

2 METHODOLOGY

2.1 Workshop Introduction and Objectives

The goal of the workshop is to engage inspiring tech- and engineering companies to actively engage in this challenge and pioneer initiative.

The objectives are to help participants to communicate a clear example of the impact of their STEM work in society through a pitch and to ideate possible Open Educational Resources (OERs) on identified best examples co-developed with secondary students in the framework of the projects mentioned above, that can be shared broadly and used by STEM teachers in Switzerland and abroad.

Helping STEM experts to clearly exemplify their engineering impacts to society in an inspirational way and co-ideating possible OERs to share that message can bridge the gap in educational materials for sciences, engineering, and physics, contextualizing them with the SDGs.

2.2 Participants and Target Audience

The target groups were:

1) Experts and engineers from tech companies, start-ups, spin-offs, but also those working at interfaces of R&D, Knowledge Transfer and Technology Transfer, and who are interested in sharing in a clear way the societal impacts of their work with upper secondary students of Switzerland and are open to potentially create OERs about them.
2) Learning science PhD students and educators seeking innovative ways to incorporate real-world engineering problems and solutions into their curriculum will be invited to attend to contribute in the ideation session in order to include themselves in the possible co-creation of the OERs afterwards.

2.3 Workshop Structure

- *Introduction*

Opening remarks gave the frame to the workshop's purpose and context.

- *Pitch Session*

Main part of the workshop were the 10 minutes pitches of four well selected STEM experts from diverse engineering backgrounds representing the partners from industry and research who inspired high schools' students during the Swiss pilot of Youth@STEM4SF in 2024. They showcased an example how their STEM work contributes to our everyday lives, society and SDGs. The speakers delved into the scientific and engineering principles behind their technologies, highlighting the tangible benefits these innovations offer to society. All these ideas (see Section 3.1) have a potential to be further developed and implemented in form of educational resources, e.g. as part of the ResponSE project [11] scale-up in 2025 and beyond.

- *OERs Ideation and Conclusions*

Based on pitches, the participants were asked to brainstorm about potential OERs, such as games, simulations or apps. The session wrapped up by underscoring the importance of sharing engineering's positive societal impacts through compelling narratives and how OERs and digital education can help to achieving this goal in an accessible manner.

2.4 Significance for Engineering Education

The workshop aims to inspire engineers and educators by showcasing engineering's critical role in sustainable development and its untapped educational potential by:

- Connecting engineering with sustainability, technology, and societal impact.
- Demonstrating how engineers can enhance STEM curricula.
- Advocating for teaching global problem-solving in engineering education.
- Encouraging collaboration to create innovative teaching methods.
- Highlighting the engineering community’s role in inspiring future professionals.

3 RESULTS

3.1 Inspiring engineering stories for sustainable future

3.1.1. Hadron therapy for cancer

Luca Gandolfi (Tera *Foundation on Oncological Hadron Therapy Accelerator*) and Yiota Foka (GSI [15]) presented the educational program connecting STEM, in particular particle physics with medicine, particle therapy for cancer treatment, particular sensitive topic. Under the umbrella of the International Particle Physics Outreach Group (IPPOG) [16] International MasterClass programme [17], a Particle Therapy MasterClass (PTMC) [18, 19] package was developed, where particle physicist reach to high schools students (e.g. in 2021 online version attracted 1500 students in 20 countries). The main idea is to (a) provide a basic understanding of cancer radiation therapy, (b) demonstrate that fundamental properties of particle interactions with matter, which are used for detection in physics experiments, are also the basis for treating cancer tumours; and (c) show that the same accelerator technologies are used in both, research laboratories and therapy centres. During this experience students use the become a team of medical doctors and scientists, using the open-source professional Treatment Planning software matRad, developed for research and training by DKFZ, the German cancer research institute, Heidelberg. With this tool students simulate the radiation of cancer and healthy tissue with different types of particles (photons (X-rays), protons, ions…) learning how important it is to understand the physics of interactions of different elementary particles. Students experience that photons irradiate also healthy tissue before and after the target (tumor), while protons and ions (e.g. carbon) deposit their energy at the target only, and thus spare the healthy tissue.

Short adaptation of the PTMC (which is usually the whole day activity) has been implemented at the Youth@STEM4SF day in Zurich in June 2024. The aim is to develop short user-friendly gamified version of the matRad PTMC, that would be accessible online (e.g. in form of Graasp OERs) without need of installation of software package, and providing an engaging, inquiry-based learning tool implementable to science curricula for the use by the high school teachers.

3.1.2. Engineering innovation for water preservation

One of the challenges we face as a society today, is the clean water scarcity. The innovative solutions are required that only science and technology can provide. The innovative start-up GJOSA [20], created by SWATCH engineers, and integrated to LOREAL, provides Swiss engineering innovation for water preservation. Intelligent solutions engineer at GJOSA, Caroline Jackson, presented how skills learned in STEM are applied at GJOSA technology to create water-efficient showerheads that reduce water consumption without compromising user experience, while minimizing waste.

Designing a water-saving showerhead relies heavily on various scientific concepts learned in engineering classes [21,22]. Fluid dynamics plays a crucial role in understanding how water flows through pipes and nozzles, ensuring efficient flow with minimal water consumption. The continuity equation aids engineers in calculating how reducing the nozzle size increases water speed while using less volume. Thermodynamics also comes into play, as the showerhead is designed to conserve not only water but energy, reducing the need to heat excess water. Finally, problem-solving and design thinking are essential in overcoming challenges in efficiency, performance, and user satisfaction - key skills in any engineering project.

This example shows how by choosing a path in Engineering and Science, one is equipped with the skills to tackle these challenges head-on, and has the power to be a part of the solution, to drive change, and to inspire others. The GJOSA technology was awarded Time Best Inventions 2021 [23].

3.1.3. Engineering a Cleaner future: Catalysing change in tough-to-decarbonize industries

Daphne Technology [24], a Swiss climate deep-tech firm, specialises in solving Greenhouse gas (GHG) challenges in hard-to-decarbonise industries. The company develops technologies and scales innovative products to measure and reduce GHG emissions from industrial sources, using a portfolio approach for global decarbonisation in power generation and energy conversion [25, 26].

Behnaz Varandili, Senior Scientist at Daphne Technology, presented three innovative products developed by the company: SlipPure, an innovative after-treatment system, is tailored to remove methane from exhaust gases in natural gas-fired internal combustion engines in maritime, oil & gas, and land-based industries. It is an environmentally responsible, technologically advanced solution, helping industries meet sustainability targets by cutting their carbon footprint. SulPure is a key player in environmental sustainability, targeting the elimination of sulphur oxide (SOx) pollutants from exhaust or flue gases. Its unique circular economy approach curbs harmful emissions and converts them into valuable resources, notably ammonium sulphate fertiliser for agricultural purposes. Dedicated to mitigating SOx pollution, SulPure serves multiple sectors, including coal-fired power stations and sour gas (H2S) flaring. PureMetrics is a pioneering solution for measuring, reporting, and optimising GHG emissions of industries in real-time and with accuracy.

Daphne Technology is a perfect example how multidisciplinary engineering for innovation offer solutions thanks to knowledge in physics, chemistry, mechanical engineering etc.

3.1.4. How Can Innovative Industry Software Help to Inspire a Passion for Sustainable STEM?

Sven Friedel, managing director of COMSOL Switzerland [27], the physics-based industry with long-term tradition and vast experience in the Software for Multiphysics Simulations, shared with the participants how these simulations work in service for sustainable solutions and even education.

The industrial development and optimization of sustainable technologies, such as electromobility, next generation of batteries, solar cells, electrolyzers, fuel cells, fish-protecting hydropower turbines, live-saving medical devices, food safety, climate change monitoring and mitigation and more have become unthinkable without highly specialized simulation software [28]: algorithms that are able to integrate mechanics, acoustics, heat transfer, electro- and fluid dynamics, mass transport, etc. As a subtask in the R&D process, models and ideas often need to be communicated to non-simulation experts, which is accomplished by embedding highly complex physical, chemical, or biological models into easy-to-use user interfaces, so-called simulation apps that allow playful exploration of science and engineering topics [29]. Royalty-free simulation apps running on Win, Mac, or Linux OS, or accessed via browsers from any device covering diverse interesting topics like superconductivity, acoustics, food safety and many more, are today also widely used in teaching at academies and high schools [30, 31, 32] and occasionally at the primary school level. STEM teachers on all levels can concentrate on aspects of didactics and gamification while relying on industry-proven standards for visualization, numerical concepts and app development, in order to create with ease captivating tools for STEM education.

3.2 Learning Outcomes

Participants have learned about the integration of engineering innovations with sustainable development goals (SDGs) and opportunities how these can be transformed into educational content. Specifically, they increased the awareness and gain insights into:

- The crucial role of engineering in addressing global sustainability challenges (SDGs) through real-world examples.
- The process of translating complex engineering concepts into accessible educational resources / success stories relatable to lay audience.
- Ideation processes for developing digital tools, games, or apps that convey the importance of engineering to young learners.

The objective is to empower engineers to communicate their work's societal impact effectively and inspire public and the next generation through education.

3.2 Result’s Summary

The workshop was a call to action for engineers deeply involved in sustainable development to extend their impact beyond the industry, contributing to educational content that can inspire future generations. By leveraging their innovative work for the SDGs and translating it into inquiry-based learning resources, the workshop aimed to fill the educational void in STEM subjects, contextualizing them within the broader societal and environmental challenges of our time.

- *Take-Home Message:* Participants left with the understanding that engineering has a profound impact on society and that this impact can be amplified through education. They were encouraged to consider how their work can be used to inspire future generations.
- *Open Education Resources*: The ideas presented in pitch session and discussed further will be further analysed in the framework of the ResponSE project, aiming to co-create new OERs in close collaboration with the workshop participants. These and other OERs co-created also with students and teachers through the Belearn Hackathons aim to be offered to ensure its usage through learning experience platform Graasp by science teachers’ community in Switzerland and abroad.

ABSTRACT

Underpinned by our joint consensus about the importance of collaborative project experiences in undergraduate engineering, this study reflects on the often-missing interconnectivity between engineering practice and academic studies by exploring the development of interpersonal skills during undergraduate teamwork. Using the lens of friendships and attachment styles as our underpinning theoretical framework, our aim is for this workshop to act as a collaborative think tank aimed at designing a framework that can be adapted across contextual settings and used by engineering educators who are engaged in supervising student group work projects.

The intended framework is aimed to empower instructors, supervisors and scholars with the necessary support that would enable them to make use of team working spaces as a catalyst for empowering students to form healthy collaborations, networking relations and friendships. This work is relevant to the larger engineering education community for three reasons. Firstly, it addresses questions of student wellbeing and offers a practical tool for educators in this regard. Secondly, it bridges the gap between the skills needed for engineering practice and those fostered during academic studies. Thirdly, it is the first of its kind to challenge instructors to expand their self-perception in terms of their roles in facilitating student friendships in group project supervision.

INTRODUCTION

1.1 Teamwork in Undergraduate Engineering Education

Engineering work relies heavily on socially interacting with co-workers and clients. The complexity of today's socio-technical problems and the reality of distributed knowledge (i.e., no one knows everything), demands engineers who know how to work in diverse teams and engage in collaborative teamwork. To fulfil this need, universities worldwide include teamwork activities in their curricula (ABET 2021; ECSA 2020). Teamwork allows students opportunities to learn to listen, trust, and get along with others (Picard et al. 2022).

For more than a decade, there have been efforts to bridge the gap between academia and industry in engineering education, leading to the integration of 21st century skills into the curriculum (Schefer-Wenzl and Miladinovic 2020). The result is the so-called integrated curriculum (Fung 2017), which intertwines societal, cultural and contextual matters with technical learning objectives. At the heart of these 21st century skills is the ability to work in teams. Most engineering programs incorporate projects that require students to collaborate within groups over an extended period to solve complex problems.

However, undergraduate engineering students sometimes see teamwork as a waste of time, citing challenges in scheduling meetings with their peers outside of class and difficulties collaborating with people who approach tasks differently (Chang 2018; Rajabzadeh et al. 2022). In such instances, team members may resort to strategies such as "divide and conquer" instead of adopting a collaborative and integrated approach. This individualistic mindset privileges personal interests and priorities over the common goal of the team project. By neglecting communication, active engagement and efforts to develop mutual understanding, teams miss out on valuable opportunities for intercultural interactions, empathy-building, cultivating creativity, and skill development (Göl and Nafalski 2007). In the end, this hinders the development of friendship among engineering team members.

1.2 Friendship and Attachment Styles

Pillemer and Rothbard's (2018: 637) definition of workplace friendship fits the context of our study: "a nonromantic, voluntary, and informal relationship between current coworkers that is characterized by communal norms and socioemotional goals."

Friendship development depends on our views of ourselves and others. Bartholomew and Horowitz (1991) describe four quadrants of attachment styles: secure, dismissing, preoccupied, and fearful. Raising awareness of these styles may encourage self-reflection, empathy, and stretching beyond default patterns of behaviour when undergraduate engineering students interact with each other.

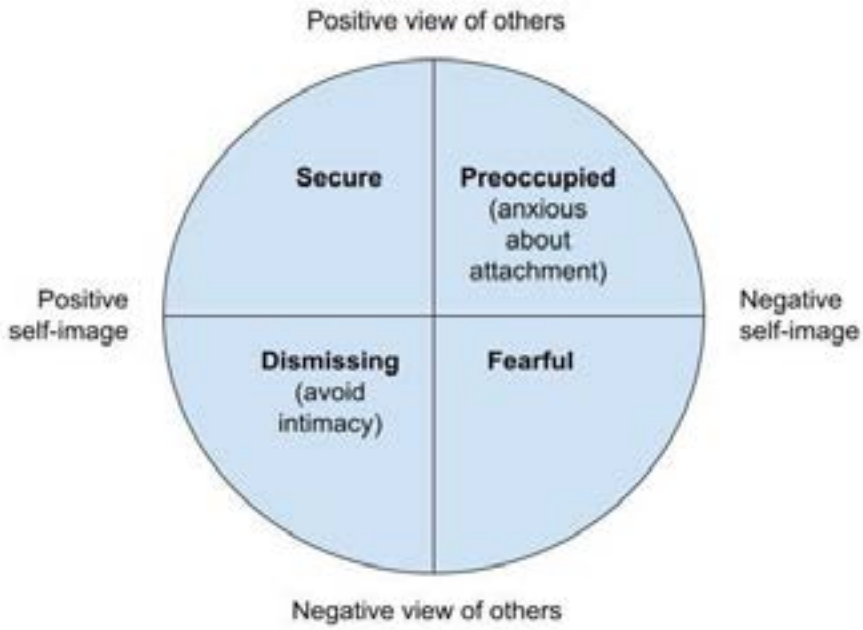

Fig. 1. Attachment styles among young adults (adapted from Bartholomew and Horowitz 1991)

- Secure individuals find it easy to form emotional bonds, value cooperation in friendships, and seek balance in relationships.
- Dismissing individuals prioritize independence, invest minimally in friendships, and downplay their importance. They are "high in self-confidence and low in emotional expressiveness" (Walsh and Houser 2010: 353).
- Preoccupied individuals desire friendships but may feel others are reluctant, often becoming overly self-sacrificing or anxious in relationships. They display high levels of self-disclosure and negative self-image.
- Fearful individuals want closeness but struggle with trust, often fearing potential hurt from others.

Alerting students to these general styles may help them recognise potential obstacles when they try to make friends. It is important to note that some researchers have identified negative outcomes from friendships in groups (Wang et al. 2023; Pillemer and Rothbard 2018). Guidelines from instructors on behaviour expectations when working in teams may help develop trust, cooperation and balance.

1.3 The Impact of Friendships on Undergraduate Engineering Students

To our knowledge, very few scholars have explored the intersectionality between friendship and student group work in the context of undergraduate engineering (Li et al. 2022; White et al. 2022; Schmidt 2020; Shapiro 2011). Since human interactions form a substantial part of a balanced learning experience (Casado, Lopez and Lapuerta 2016), we are interested in exploring this topic further by tapping into insights from engineering educators across different contexts. The next section presents the aim of this workshop in more detail.

2 WORKSHOP AIMS, LAYOUT AND STRUCTURE

2.1 Objectives of the workshop

The workshop was carefully designed to fulfil its objectives and cater to the needs of the workshop audience. With a clear focus on unpacking the complexity and potential of extended interpersonal interactions among students in group settings, the workshop aimed to provide a platform for participants to share their experiences, including success and failure stories, within their unique contexts. Through collaborative efforts, a framework was developed to empower academics, supervisors, and instructors to foster friendships, think-tanks and networks within student groups. This workshop was most relevant to those involved in designing and teaching group work activities for undergraduate engineering students.

2.2 Workshop structure

Engagement and collaboration among participants were actively encouraged to facilitate meaningful discussions and idea exchange. The workshop's duration was carefully calibrated to ensure optimal effectiveness without overwhelming attendees. In the first ten minutes of the workshop, the authors' team started by providing a short description of the key concepts and explaining the structure of the workshop. The workshop participants then engaged in discussion based on the prompts in Table 1 below, which would later make up the components of the framework. The last five minutes were used to summarise the outcomes of the workshop and inform the participants of the logistics of accessing the discussion points from an interactive platform (Padlet). Based on the consolidated outputs of group discussions, the aim was to map different discussion points arising from the activities facilitated by the authors into a navigational framework that would help inform higher education instructors. Ultimately, the outcome of the workshop, along with comprehensive documentation, would equip readers with actionable insights and strategies for designing and teaching group work activities, which would be particularly beneficial for those involved in educating undergraduate engineering students.

Table 1. Key discussion topics

Key topic	Prompt

1. Understanding the Dynamics of Group Interactions	Exploring the complexities of interpersonal relationships within student groups. Identifying factors that contribute to trust, cooperation, and balance within groups.
2. Strategies for Building Trust and Cooperation	Discussing methods to foster trust and cooperation among group members. Exploring techniques for promoting open communication and conflict resolution within groups.
3. Balancing Roles and Responsibilities	Examining strategies for distributing roles and responsibilities equitably within groups. Discussing approaches to ensure accountability and fairness in task allocation.
4. Developing Group Work Guidelines	Brainstorming guidelines for effective group work that promote trust, cooperation, and balance. Collaboratively drafting a framework for group work guidelines tailored to engineering students' needs.
5. Understanding the Impact on Learning and Retention	Reviewing research findings on the influence of group dynamics on learning outcomes and retention rates among undergraduate engineering students. Discussing strategies to enhance student engagement and retention through effective group work practices.
6. Promoting Diversity and Inclusion	Highlighting the importance of diversity within student groups and its impact on learning outcomes. Exploring ways to cultivate an inclusive environment that respects diverse worldviews and beliefs.
7. Gender Dynamics in Group Interactions	Analyzing research findings on how gender influences social outcomes within student groups. Discussing strategies to mitigate gender disparities and promote equitable participation and outcomes for all students.

By incorporating these topics into the workshop discussions, participants would gain valuable insights into effective group work practices tailored to the needs of undergraduate engineering students. Additionally, dedicating time for brainstorming group work guidelines fostered collaboration and empowered participants to develop actionable strategies for promoting trust, cooperation, and balance within their respective academic environments.

Session participants were expected to gain a comprehensive understanding of effective strategies for fostering trust, cooperation, and balance within student groups, particularly among undergraduate engineering students. By delving into key topics such as group dynamics, role balancing, and the influence of same-major friendships on academic and social outcomes, participants were expected to emerge equipped with practical insights and actionable guidelines for designing and facilitating successful group work activities. The session's relevance lay in its direct applicability to the challenges faced by educators and instructors in promoting collaborative learning environments that enhance student engagement, retention, and academic success. The session culminated in the synthesis of key findings and take-home messages, providing participants with a clear roadmap for implementing effective group work practices within their educational settings.

2.3 Workshop Outcomes

Discussion points were captured on a Padlet, available at https://padlet.com/anita_campbell1/sefi-workshop-promoting-friendship-through-teamwork-in-under-bc5quolkivdex9c5

The following synthesis of key findings for successful teamwork to guide practical implementation by instructors was complied with the help of ChatGPT 4.0.

Facilitate Meaningful Connections in Groups

- Prioritize building connections rather than simply task-focused collaboration. Encourage relationships through shared experiences and a sense of mutual respect. Focus on friendship traits such as trust, laughter, and support to strengthen group bonds.
- Address cultural, social, and emotional dynamics, acknowledging that emotional closeness often requires physical proximity and shared values. Instructors should be aware of the role these dynamics play in group cohesion and learning outcomes.

Equip Teams with Tools to Navigate Conflict and Manage Dynamics

- Provide teams with training on managing task completion, conflict resolution, and communication to ensure they work together effectively. Encouraging students to reflect on external factors that may impact the group can help manage tensions.
- Establish clear group guidelines, including roles, responsibilities, and a code of cooperation, to prevent misunderstandings and maintain a productive environment.

Balance the Task Complexity with Team Capability

- Design tasks that challenge students but allow them to collaborate effectively, without leaving anyone behind. Ensure that individual contributions are valued, but team success is emphasized.

- Adjust the expectations of teamwork duration to match the complexity of the tasks, recognizing that the group will need time to go through various stages of development before reaching optimal performance.

Support Trust and Cooperation Through Structured Activities

- Use icebreakers and structured tasks that require cooperation to foster a team spirit. These activities help students move past initial discomfort and begin to rely on each other, leading to more effective teamwork.
- Integrate trust-building strategies and emotional reflection into the curriculum to deepen connections within the group and improve the overall group experience.

Promote Inclusivity and Cultural Awareness in Group Settings

- Recognize and address cultural, social, and gender-related dynamics that may influence group behaviour. Encouraging inclusive practices will help diverse groups of students feel comfortable and contribute meaningfully.
- Utilize tools and strategies like "tangibles" or buddy systems to ease social anxiety, particularly in students who may find it difficult to form connections. Ensure that group processes account for the different emotional and relational needs of students from various backgrounds.

3 RELEVANCE AND FUTURE WORK

Conscious of the realisation of importance of the socio-emotional development of engineering students (Casado, Lopez and Lapuerta 2016), our aim was to unpack different ways in which we, as engineering educators, could foster micro-cultures where trust and friendship are empowered. The impact is relevant on several levels. Firstly, an emphasis is created between the socio-emotional development necessary for real life practice interactions in the engineering field and the academic experience of engineering students. This work will therefore contribute to further strengthening the bridges between academia and practical settings in the engineering field. Secondly, through the development of this framework, educators will have a tool that will enable them to foster the creation of a safe and secure platform, whereby students can learn how to positively approach colleagues and create healthy collaborative work and networking opportunities. This is a crucial empowering tool that educators need to be more aware of, especially in light of the growing globally challenges we face today. Thirdly, from the perspective of student wellbeing, this work promotes the reduction of the culture of competition, which is very damaging to student health and wellbeing (Gadola and Chindamo 2017).

Effective collaboration and the cultivation of a healthy collaborative working environment are essential to the success of engineering practice experiences. We anticipate that the framework created will be adaptable and add value to engineering educators supervising engineering projects around the world. Furthermore, this work holds significant implications for Engineering Education, as it offers tailored solutions to address the unique needs and challenges encountered by engineering students in group settings This, in turn, contributes to the enhancement of learning experiences and outcomes within the field.

***Conference Key Areas**: Building the capacity and strengthening the educational competences of engineering educators*
***Keywords**: grants; fellowships; funding; internationalization; study abroad*

ABSTRACT

This workshop was geared toward educators seeking to enhance their research capabilities, explore new areas of inquiry, and expand their professional networks through collaborations with colleagues from institutions beyond their national borders. The facilitators introduced the topic and described various pathways to securing fellowships for engineering education research (EER), including prestigious Fulbright, Marie Curie, and EU-funded fellowships. Via practical demonstrations, participants learned how to navigate relevant databases, identify suitable fellowship opportunities, and strategically align their research interests with funding priorities. Participants interacted with previous recipients of grants and fellowships awarded to individuals for research and/or professional development. Overall, the workshop leveraged collective expertise to help participants envision and strategise fellowship opportunities to maximise their chances for future success. Attendees were provided with essential resources, actionable steps for proposal development, and valuable tips to strengthen their funding applications. The ultimate objective of the workshop was to empower participants to secure funding for impactful EER projects, enabling them to advance their research agendas and contribute to the broader landscape of engineering education.

Figure 1: Workshop facilitators (pictured left to right: Aditya Johri, Shannon Chance, Madeline Polmear, Helena Kovacs, Inês Direito, Sandra Cruz, and Rucha Joshi).

1 MOTIVATION AND LEARNING OUTCOMES

The motivation for organising this workshop was to leverage the collective expertise of lead facilitators in securing fellowship funding for international research endeavours and to facilitate entry into the global EER community. The aim is to empower participants to secure funding for research activities and contribute to capacity building within the EER community.

Drawing from pertinent literature (Locke et al. 2013; O'Neal-McElrath et al. 2019; Ward 2006) and personal experience obtaining Fulbright and Marie Skłodowska-Curie fellowships (Chance, 2013; 2020a; 2020b), the lead facilitator guided participants in envisioning pathways to funded research in countries beyond their own. The overall group of facilitators highlighted funding programs highly relevant to the SEFI audience, focusing on fellowship opportunities for Ph.D. candidates, post-doctoral researchers, established researchers, and educators interested in conducting research abroad.

Learning Outcomes:

1. **Understanding Grant and Fellowship Processes:** Participants gained insights into the fundamental processes of obtaining grants and fellowships, including application procedures and competition dynamics.
2. **Exploring Fellowship Programs:** Attendees learned about fellowship programs that facilitate study and research throughout Europe and the US,

regions where EER is well-established, enabling them to extend their research skills and networks.

3. **Navigating Databases and Identifying Funders' Objectives:** Participants discovered where to find databases listing research jobs and fellowships and developed skills in identifying funders' objectives to align their proposals effectively.
4. **Networking and Contacting Prospective Hosts:** Facilitators identified strategies for contacting prospective hosts and leveraging networks to facilitate collaborative research opportunities.
5. **Querying Successful Awardees:** Participants were invited to follow up with the facilitators to query their strategies and experiences and, thereby, enhance the participants' capacity to develop competitive proposals.

Target Audience:

This workshop was designed for individuals interested in pursuing international research opportunities in EER and ambitious enough to seek external funding through competitive applications. Prospective participants had a keen research interest, the desire to develop new skills, a collaborative mindset, and a curiosity about exploring diverse cultures and environments.

2 BACKGROUND AND RATIONALE OF THE SESSION

The facilitators involved in this workshop brought valuable experience as recipients of EER fellowships, including awards from the European Union-based Marie Curie program and the US-based Fulbright program. Motivated by their prior success, they are eager to assist others in securing funding for EER projects.

The term 'fellowship' encompasses various opportunities, often representing postdoctoral positions in the European Union, the United Kingdom, or the United States. In the EU and UK, fellowships may also support individuals seeking doctoral degrees, not solely those holding doctorates.

Fellowships allow academics to pursue focused, independent research or academic projects; the funding can facilitate deep engagement in one's chosen fields. Funders typically aim to (a) generate new knowledge and research insights and (b) cultivate skills among recipients, often supporting international travel for work and study. The financial stability fellowships provide enables recipients to concentrate on their research endeavours.

Securing research funding in a competitive environment entails several key steps, including identifying a suitable funding source, studying the funders' guidelines and priorities carefully, aligning strategically with funders' priorities, developing a clear and compelling research/project proposal, building solid research or supervisorial teams, meticulously crafting the proposal, and leaving time to seek expert feedback to refine the proposal before the submission date.

Given the prestige of research fellowships, applicants must demonstrate outstanding academic achievements. Successful applicants often submit a comprehensive curriculum vitae or significant research output, such as a journal article, as part of their application. They typically also require the development of a research project, including a description of why it's needed (research excellence), what difference it will make in the world (impact), how it will be carried out, and what supports will be provided by the host organization (implementation).

As noted above, applicants are advised to thoroughly understand the application requirements and guidelines, seeking clarification from program coordinators or project officers when needed. Following guidelines meticulously is crucial to avoid disqualification. Additionally, seeking advice from previous fellowship recipients or specialists, such as National Contact Points in European host countries, can provide valuable insights and guidance.

This workshop explored such strategies, aiming to equip participants with the knowledge and skills to construct successful fellowship applications in EER.

3 ENGAGEMENT OF AND INTERACTION

The workshop incorporated active learning, leveraging technology to facilitate interactive sessions. Participants were encouraged to bring WiFi-enabled digital devices to enable online searching throughout the workshop.

Utilising online databases, participants explored job and fellowship opportunities within the European Union and accessed Fulbright platforms in the United States and their current countries of residence. This hands-on approach aimed to empower attendees to conduct real-time searches and identify relevant opportunities aligned with their research interests and career goals.

The open discussion format promoted interaction, allowing participants to share their preferences regarding geographical locations, research topics, and targeted funding programs. The discussion helped foster collaboration, exchange of ideas, and strategic alignment among participants, enriching the learning experience and facilitating networking opportunities. Participants were encouraged to connect with the facilitators regarding the fellowships they had completed. They also introduced the website and databases for their respective programs:

The **EURAXESS** website (https://euraxess.ec.europa.eu/) provides an extensive database of all European-funded research fellowships, jobs, and grant programmes. The facilitators involved in activities listed in the EURAXESS database are:

- **Shannon Chance**, who described her experience with two individual fellowships funded by Marie Skłodowska-Curie Actions (MSCA), which can be found at https://marie-sklodowska-curie-actions.ec.europa.eu/ or via the EURAXESS website.
- **Madeline Polmear**, who discussed university-organized post-doc funded through MSCA.
- **Helena Kovacs**, who discussed participation in MSCA-funded Ph.D. studies.
- **Sandra Cruz**, who described her experience with ERASMUS funding for a European Master's degree, listed at https://erasmus-plus.ec.europa.eu/opportunities/opportunities-for-individuals/students/erasmus-mundus-joint-masters
- **Inês Direito**, who highlighted European Research Council (ERC) opportunities which can be found at https://erc.europa.eu/ or via the EURAXESS website.

Fulbright supports the exchange of students, academics, and professionals between the United States and more than a hundred countries worldwide. The facilitators who have served as Fulbright Scholars are. Prospective applicants can visit https://fulbrightscholars.org/

- **Aditya Johri**, who discussed his participation in both the Fulbright Core Scholars programme and the Fulbright Specialist programme (https://fulbrightspecialist.worldlearning.org/).
- **Shannon Chance**, who also served as a Fulbright Core Scholar.

Many other opportunities exist as well, as experienced by our facilitators:

- **Aditya Johri**, who discussed US National Science Foundation (NSF) support for facilitating international collaborations.
- **Sandra Cruz**, who identified databases for scholarship funding for Ph.D. studies in Europe and the UK, like FindAPhD (https://www.findaphd.com/).
- **Inês Direito**, who described her experience with country-specific funding.
- **Rucha Joshi**, who identified funding opportunities for researchers to travel to and conduct research in India listed at https://aistic.gov.in/ASEAN/ICDST and https://icssr.org/

Through these interactive activities, participants gained insight into fellowship opportunities and developed initial plans to pursue funding for their EER endeavours, leveraging their peers' and facilitators' collective expertise and support.

4 TAKE HOME MESSAGE

Funding opportunities abound for those eager to explore new places and develop research skills. Although crafting a winning proposal requires time and perseverance, it is an achievable endeavour with the right strategy in place. Our facilitation team is committed to supporting participants throughout this journey, offering guidance and expertise to navigate the process successfully. With determination and strategic planning, funding for international research is within reach!

Figure 2: Participants and facilitators of the workshop.

5 Significance for Engineering Education

This workshop aimed to empower participants to secure funding for research, thereby contributing to the vibrancy and growth of our EER community. By equipping individuals with the skills, resources, and networks needed to pursue international research opportunities, SEFI helps foster capacity-building and collaboration across the EER landscape. Ultimately, this workshop's facilitators seek to advance innovative research, drive excellence in engineering education, and strengthen the collective impact that our EER community can have at European and global scales.

***Conference Key Areas**: Building the capacity and strengthening the educational competences of engineering educators*
***Keywords**: publication; journals; editing; knowledge generation; literature production*

ABSTRACT

This workshop was created for researchers seeking to elevate awareness of specific engineering education research (EER) issues or sub-domains and expand their readership and authorship base within these areas. Drawing from the experience of developing book and journal publications in EER, the facilitators shared insights into the publication process, highlighting the primary considerations involved. The discussion helped participants identify publication formats and understand the usefulness of special-focus journal issues as well as how to conceptualise publication projects, set up editorial teams, select and approach publishers, and prepare proposal documents. The open discussion format allowed participants to query the facilitators.

1 MOTIVATION AND LEARNING OUTCOMES

The workshop was geared toward researchers who want to increase the visibility of engineering education research (EER) and emerging or established sub-topics within this space. The facilitators shared their knowledge and experience (from producing e.g., Chance, Børsen et al., forthcoming; Johri, 2023; Johri & Olds, 2014; Zandervoort et al., 2013, and editing leading journals in the field, including the

European Journal of Engineering Education), the *Australasian Journal of Engineering Education*, and IEEE Education Publications) and insights gleaned from external sources (Guerin 2024; Johri, 2021; Leese 2012; Scholastica 2020).

The workshop design aimed to equip participants with the tools and knowledge necessary to navigate the publication proposal process in EER effectively to advance their research agendas strategically. The session was intended to help participants:

1. **Identify Publication Formats:** The facilitators explored various publication formats available in EER, including wholly authored works and edited collections, and identified publishers accepting such works.
2. **Describe Special-Focus Journal Issues:** Participants learned about special-focus journal issues and their appeal to journal editors in EER.
3. **Conceptualise Projects:** Attendees considered how to conceptualise EER projects, including defining scope, objectives, and target audience.
4. **Set up Editorial Teams:** Participants acquired knowledge on assembling and leading editorial teams for EER publications to help ensure effective project management.

5. **Select and Approach Publishers:** Participants learned strategies for choosing appropriate publishers for their EER projects and how to approach them effectively.
6. **Prepare Proposal Documents:** Participants gained familiarity with proposal documents (including their structure and content), to help them begin the process of preparing one for their own EER project.
7. **Query Editors**: Participants were invited to follow up with the facilitators for advice on their envisioned projects.

2 BACKGROUND AND RATIONALE OF THE SESSION

The workshop targeted individuals keen on helping crystalise focused areas of inquiry within the expansive domain of EER. Areas already bearing some published work offer fertile ground for consolidation and synthesis – and publishing compilations or sets of manuscripts together can facilitate a deeper understanding of pertinent issues. Publications can provide visibility by showcasing collections of curated research within specific sub-topics of EER – including primary and secondary reporting of research. They can become foundational pillars upon which further exploration and advancement can be built.

By consolidating existing knowledge into cohesive collections of journal papers or book chapters, researchers can provide clarity and coherence to the collective body of inquiry. This not only aids in making sense of the diverse strands of research but also serves as an invitation for scholars to delve deeper into topics of mutual interest. Moreover, issuing calls for contributions to collaborative publications fosters a sense of community among scholars, encouraging them to converge around shared research agendas and contribute their expertise to collective efforts. By pooling resources and insights, these collaborative endeavours enrich the scholarly discourse and propel the field of EER forward in innovative and meaningful ways.

The discussions help the community:

- Clarify existing areas of inquiry within EER.
- Advance knowledge within EER.
- Encourage community engagement and shared exploration in EER.
- Advance collaborative efforts in consolidating research efforts.

Collaborative publications catalyse innovation and progress by leveraging the collective expertise and passion of scholars within the EER community, driving the field toward new horizons of understanding and impact.

3 HIGHLIGHTS OF THE SESSION

The format for this session involved the rapid delivery of overview information, in a collaborative environment that encouraged creativity and exploration of diverse perspectives. The discussions focused on:

- **Handbook** expertise with insights from **Aditya Jorhi**, **Tom Børsen**, and **Diana Adela Martin** (editors of Chance, Børsen et al., forthcoming; Johri, 2023; Johri & Olds, 2014; Zandervoort et al., 2013).
- **Special Issues** expertise with insights from **Kristina Edström** (Editor-in-Chief of the *European Journal of Engineering Education*), **John Mitchell** (Head of IEEE Education Publications), **Sally Male** (Editor-in-Chief of the *Australasian Journal of Engineering Education*), and **Inês Direito** (co-guest editor of the emotions special issue for the *European Journal of Engineering Education*).

Through these interactive sessions, participants gained insights and developed initial plans for advancing their research projects within the EER space to leverage their peers' and facilitators' collective expertise and support.

Figure 1: Publications led by the facilitators of this session.

Aditya Jordi explained how putting together a volume, like the three shown in the top row of Figure 1, can be a field-building exercise, as it sparks collaboration and networking and brings those on the periphery toward full participation. He noted that this process can lead to future collaborations among author teams who had not previously worked together. New ideas often emerge during the process, inspiring subsequent papers and projects. Additionally, such publications showcase the field's maturity to stakeholders.

Aditya also described the foundational concepts underpinning Routledge's *International Handbook of Engineering Education Research* (IHEER). He began the editing process by conducting a community-wide survey involving approximately 150 scholars. This survey helped him gather feedback on topics to include and experts who could author chapters. His primary goal was for the volume to cover new content rather than serve as an update of the earlier compilation he had edited, the *Cambridge Handbook of Engineering Education Research* (CHEER). The new volume aimed to focus on educational practice in addition to research and to be more international than its predecessor, reflecting the field's growth (though the final publication remains somewhat US-centric). Aditya employed a conference-inspired review model using EasyChair to manage the process, with leadership support from 18 Associate Editors. He adopted an open-access model, funded by the U.S. National Science Foundation.

The editorial team of *The Routledge International Handbook of Engineering Ethics Education* aimed for the highest global representation possible, a successor of IHEER. During this SEFI workshop, editors Shannon Chance, Tom Børson, and Diana Martin shared some foundational concepts of that forthcoming publication, a two-year project of SEFI's Ethics SIG. The six editors (all members and/or chairs of the Ethics SIG) aimed to produce a comprehensive collection that benchmarks the current state-of-the-art in engineering ethics education. They began with an open call for authors, to which more than a hundred scholars responded. Ultimately, 105 scholars joined the project, collaborating via transnational authoring teams that included many early-career researchers mentored by established researchers. The final result, to be published in late 2024, will contain 36 chapters and 7 overview statements introducing the various sections. The target audience includes teachers, researchers, and academic managers, with the work intended to appeal to newcomers and experts alike. The editors' university covered the open-access fee, ensuring that the digital version will be free to download.

Kristina Edström outlined the process for assembling editorial teams for special issues of journals such as the *European Journal of Engineering Education*. She recommended selecting individuals with diverse expertise, broad knowledge of the topic, and a range of perspectives, including those familiar with the relevant methodologies. She emphasised the importance of recruiting potential authors and reviewers early in the process and finding ways to reduce bias and ensure well-balanced decisions. Kristina advocated including established experts to ensure that the special issue reflects state-of-the-art standards and is considered legitimate and valuable to authors and readers. A robust editorial team is necessary to manage the workload over an extended period, facilitating timely progress and completion, she explained, echoing Aditya, Shannon, Tom, and Diana's comments about using such projects to connect people. Moreover, she highlighted the potential of these projects to link international groups, jump-start junior researchers' careers, and disseminate senior scholars' wisdom.

4 TAKE HOME MESSAGE

Engaging in EER projects to develop books and special issues requires a certain level of expertise and readiness. Individuals (i.e., workshop participants) with experience in leadership, collaboration, and successful publication of journal articles

– like those who attended this SEFI 2024 workshop – are well-positioned to undertake such projects. Beyond technical skills, the most critical aspect is envisioning the topics one aspires to champion or the message one aims to convey. A clear and compelling vision will drive the project forward, inspiring meaningful contributions and fostering community engagement within the realm of EER.

5 Significance for Engineering Education

In recent decades, EER has emerged as a vital force to further engineering education, by advancing knowledge and practice in diverse domains. The global EER community has grown substantially, producing vast, evidence-based research using various methodologies and theoretical frameworks to investigate diverse educational topics. The development of books and journal issues focused on specific topics is on the rise and can help drive the collective generation of new knowledge to advance engineering education and practice.

***Conference Key Areas**: 2. Educating the whole engineer: teaching through and for knowing, thinking, feeling and doing. 11. Engineering skills, professional skills, and transversal skills*
***Keywords**: Engagement, inspirational, enjoyment, practical, teaching design.*

ABSTRACT

This workshop introduces the concept of "filters" to enhance engagement in engineering education's practical teaching sessions. Highlighting the sparse attention practical teaching has received in academia, it proposes minor adjustments to teaching methods to significantly boost student interest. Through collaborative development and application of these filters, analogous to digital enhancements in photography, educators can apply innovative strategies to various teaching activities. The workshop aims to compile these strategies into a list to inspire and share among educators, by distributing as an open educational resource. This initiative reflects a step towards enriching engineering education by focusing on practical engagement and enjoyment.

[1] *H M Day*
h.day@sheffield.ac.uk

1 INTRODUCTION

Is it possible to enhance the engagement of practical teaching activities without altering their learning outcomes? Can we increase the enjoyment of existing practical teaching sessions with minimal effort and minimal disruption to the engineering curriculum? This workshop will explore how to reframe teaching by applying a 'filter'—making minor adjustments to the session's design to make it more appealing, while preserving the essential aspects of learning.

1.1 Workshop aims

- To collaboratively develop a "menu" of filters that can be applied to practical teaching sessions.
- To share these outcomes with the wider community, offering inspiration for educators seeking to enhance the engagement in their practical teaching.

1.2 Workshop learning outcomes

By participating in this session, you will:

- Reflect on your own memorable and enjoyable educational experiences.
- Identify the elements that made these experiences enjoyable.
- Explore how these elements could be integrated into your own teaching strategies.

2 RATIONALE FOR THE WORKSHOP

Subjects such as employability, ethics, and teamwork receive significant attention from researchers and boast a rich repository of scholarly publications. In contrast, practical teaching, such as laboratories, has garnered comparatively less attention. Most published work in the field focuses on the mechanics of how sessions are delivered, and "there is a lack of literature that shows a general dearth of well-written student learning objectives for laboratories" (Feisel and Rosa 2005). Furthermore, there is an even greater deficit of guidance for educators on how to make practical sessions engaging, enjoyable, or inspirational.

A review of laboratories in our faculty has indicated that the majority are ostensibly 'validation' activities. In these classes, students, already familiar with a theoretical concept, perform an experiment to test the theory, compare the empirical results with those predicted, and demonstrate the model to be correct, within experimental error. However, there are isolated cases of innovation in session design aimed at making the teaching of foundational engineering concepts more engaging, enjoyable, or inspirational. These are typically the result of individual academics implementing a good idea.

The rationale for this session is to attempt to collect a list of methods or tactics that can be used to reframe any practical activity to make it more engaging. This list would then be shared widely to provide inspiration for educators considering how to design new practical teaching sessions or adapt existing ones.

3 SESSION STRUCTURE

3.1 Introduction (5 minutes)

An introduction to the team will be provided, and the rationale described above will be discussed. Participants will then be organized into tables of groups of approximately 4-6 people, and the upcoming table discussion will be outlined. The workshop can be delivered for up to ~50 participants.

3.2 Table discussion: What makes your teaching enjoyable (10 minutes)

Participants will be asked to reflect on sessions they have taught which they believe were enjoyed by students. For inclusivity, those who are not educators are encouraged to contribute by sharing educational activities they have participated in and enjoyed. Participants will be prompted to consider what aspects of the activity made it enjoyable. A digital system will be made available for participants to complete Table 1, with a paper version provided as a backup in the event of technological failure.

Table 1. Enjoyable activities

Teaching Activity	What makes this teaching activity enjoyable?		
…..			

3.3 Presentation: What are filters (10 minutes)

The concept of 'filters' will be introduced as an analogy. Filters can be applied to photographs to enhance them, as illustrated in Figure 1. The image on the left of Figure 1 shows a river, some rocks, a hillside, and some trees. The image on the right depicts the same river, rocks, hillside, and trees, but with a filter applied to make it more appealing.

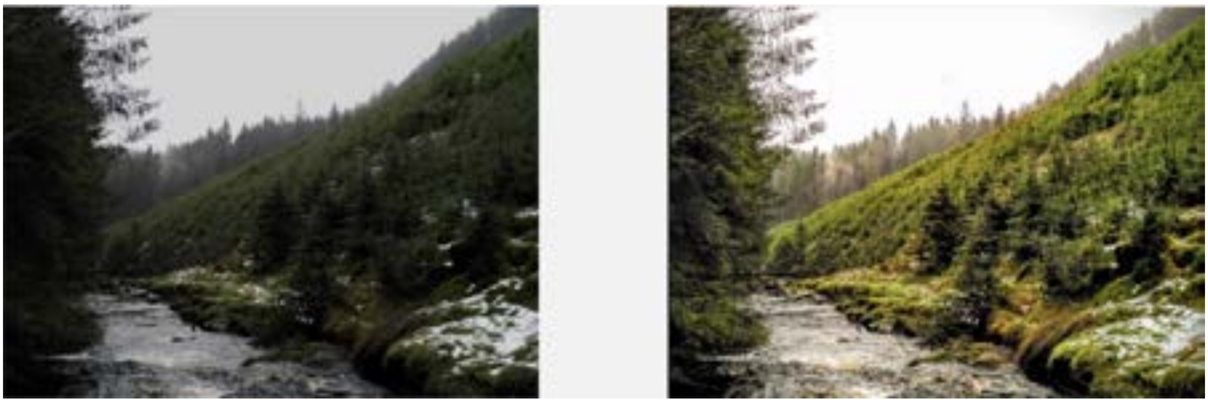

Figure 1. Two photos of the same scene, with the one on the right having a filter applied.

We propose that filters can be applied to teaching sessions. An example of a lab investigating mechanical torsion will be presented. In the original version of the lab, students are presented with specimens of a known material, perform analytical tests to determine the specimen behaviour, and compare the results to theory.

This experiment was reframed by disguising the specimens. Students performed analytical tests, then used the results and theory to deduce the material. The activities the students perform and the learning outcomes are ostensibly the same in both experiments. However, by applying a 'filter' of mystery and detective work, student enjoyment dramatically increased, from a satisfaction rating of 4.1 to 4.83 out of 5.

Mystery and detective work is one example of a filter we have identified. But are there others out there? Can we compile these into a comprehensive list to be shared?

3.4 Table discussion: Abstracting and generalising (10 minutes)

Participants will be asked to consider the enjoyable teaching activities they originally identified and can add more following the presentation. They are then asked to complete the third column of the table by determining if the aspects that made the teaching enjoyable could be abstracted and generated into a 'filter.' A filter should be applicable to types of teaching beyond a specific activity.

Table 2. Abstracting and generalising

Teaching Activity	What makes this teaching activity enjoyable?	Filter: Abstracting and generalising the enjoyable feature	
…..			

3.5 Table feedback (10 minutes)

Tables will have the opportunity to feed back to the whole group the filters that they have managed to identify.

3.6 Table discussion: Drawbacks (10 minutes)

The final task will be to ask tables to consider if there are any drawbacks or operational aspects of the filter that may need to be considered. For example, do any of the filters reduce the inclusivity of activities or compromise data protection?

Table 3. Considerations

Teaching Activity	What makes this teaching activity enjoyable?	Filter: Abstracting and generalising the enjoyable feature	What are the drawbacks or aspects to consider?
…..			

3.7 Wrap up and conclusions (5 minutes)

The session will be wrapped up. This will include a task for participants to reflect on the filter and consider which could be applied to a specific example of their teaching.

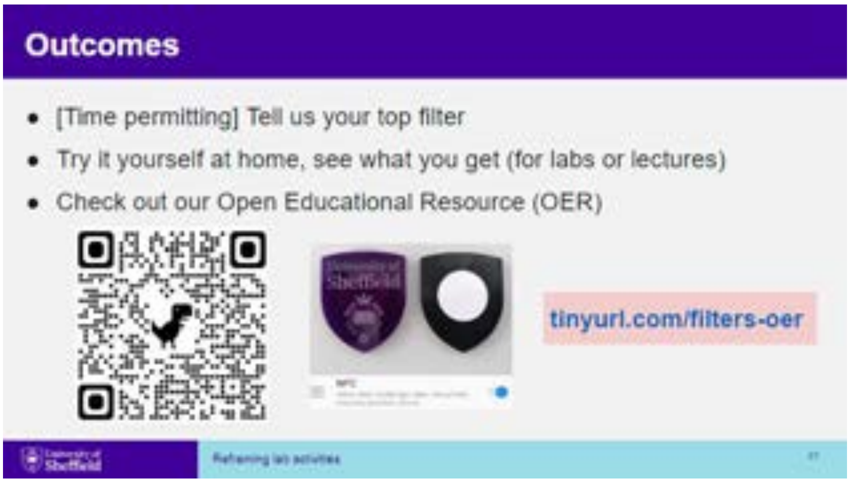
4 OUTPUTS & WORKSHOP REPORT

The workshop ran with some engaged and enthusiastic delegates, who were able to work through the exercises of considering and reflecting on their best teaching activities. This worked within the structure of 3 guided roundtable exercises where delegates discussed practice from their own context, shared and recorded ideas.

The workshop culminated with each group formulating a list of their own *Filters*, which were then discussed at length verbally within the room.

Delegates had 3 main takeaways from the workshop:

- Firstly, they can take and implement the process of the workshop within their own institution by engaging colleagues. This could prove beneficial to share best practices in a rich and focussed manner within departments.
- Second, the discussions provided some very insightful and valuable ideas and best practices which can be implemented at home.
- Finally, a digital resource was provided to all delegates:
  This is an [Open Educational Resource]() (website) containing the culmination of a department wide project within the University of Sheffield, to formulate a list of *Filters*. The resource readily offers ideas and inspiration for educators looking to improve and redesign their teaching sessions.



The authors also gained value from the workshop, in listening to the contributions of the delegates. Their ideas for various *Filters* in their own contexts will help shape further improvements and iterations being made to the Open Educational Resource.

ABSTRACT

Engineering Education Research is not only a growing but also a fastly maturing research field. The goal of the SEFI Special Interest Group (SIG) of Engineering Education Research is to support the growth and maturing of the engineering education research community in Europe and beyond. With this workshop the SIG launched a new initiative to support the community: a reading club around the recent "International Handbook of Engineering Education Research" (Johri, 2023). The goal of this reading club is to (1) increase the knowledge around engineering education research methodology, (2) to strengthen the engineering education community feeling, and (3) to give a platform to the authors of the handbook's chapters to disseminate their work. The workshop was be the official kick-off of the reading club, which will be continued throughout the coming year in collaboration with other SEFI SIG's using the platform of the SEFI@work sessions. In this first session, Jenni Case

[1] *Tinne De Laet*
tinne.delaet@kuleuven.be

presented the handbook’s 7th chapter: “The Role and Use of Theory in Engineering Education Research”.

1 MOTIVATION

The field of multi-disciplinary research in engineering education is rapidly evolving. New research teams are being established over Europe, research methodologies from other research fields are adopted, and new insights around engineering education research are emerging regularly. Keeping up with the growth and further supporting this growth can be challenging. The SEFI Special Interest Group (SIG) of Engineering Education Research recognizes this challenge and wants to call upon the power of collective learning and community engagement to overcome it. The motivation behind this workshop and the subsequent reading club is to create a platform where engineering education researchers can come together to learn, discuss, and grow.

2 EXPECTED LEARNING OUTCOMES

The workshop was designed with the following outcomes in mind:

1. **Deepen their Understanding of Engineering Education Research**: Gain a comprehensive understanding of the methodologies used in engineering education research through the exploration of the “International Handbook of Engineering Education Research”.
2. **Community Engagement:** Become an active member of the community of European engineering education researchers, and engage in stimulating discussions and collaborative learning experiences.
3. **Author Insights:** Hear directly from the authors of the handbook’s chapters, directly gain insights into their work, and have the opportunity to ask questions and discuss their research.
   During the conference workshop Jenni Case will present the chapter: “The Role and Use of Theory in Engineering Education Research”.
4. **Continued Learning:** Participate in an ongoing learning experience that extends beyond the workshop, as the workshop will be continued in a reading club during the SEFI@Work sessions.
5. **Networking Opportunities:** Connect with like-minded individuals who share a passion for engineering education research. These connections can lead to future collaborations and enrich the attendees’ professional network.
6. **Co-design the Format of the Reading club:** As part of the workshop, we will collaboratively shape the structure of the upcoming reading club with our participants using co-creation. This participatory approach aims to identify and implement the most effective formats that will actively involve and engage the European engineering education research community.

Additionally, the workshop and subsequent reading club is intended to **strengthen the SEFI SIG’s themselves**. For each of the subsequent reading clubs (SEFI@Work sessions), one of the SEFI SIG’s will be in charge. They can select a chapter that aligns with their interest and shape the sessions connected to it by building on the common format. We believe this will not only strengthen the connection between the SIGs, but also create easy opportunities for the SIGs to reach out to the wider SEFI community during the SEFI@Work sessions.

3 BACKGROUND AND RATIONALE OF THE SESSION

The field of engineering education research is a dynamic and rapidly evolving discipline. It encompasses a wide range of methodologies and approaches, making it a rich but complex area of study. The "International Handbook of Engineering Education Research" (Johri, 2023) is a comprehensive resource that encapsulates this diversity and depth, making it an invaluable tool for those involved in engineering education research. However, the breadth and complexity of the content can be daunting, especially for those new to the field and those wanting to stay on top of all the evolutions in engineering education research. There is a need for a supportive community and structured approach to help navigate this wealth of information.

The workshop serves as the official launch of this reading club, setting the stage for a year of collaborative learning and community building. The co-design approach to determining the format of the reading club ensures that it will be tailored to the needs and preferences of the participants, maximizing engagement and effectiveness.

In addition, by providing a platform for the authors of the handbook's chapters to share their insights, we not only enhance their visibility within the community but also create an avenue for them to effectively disseminate their work. Moreover, this initiative serves as a bridge, narrowing the gap between prominent researchers and the wider community. By facilitating direct interaction with the authors, we democratize access to expert knowledge and insights. This not only enriches the learning experience for all participants but also fosters a more inclusive and collaborative engineering education research community.

In conclusion, the reading club represents a response to the challenges of navigating the complex field of engineering education research. It leverages the power of community and collaboration to enhance learning outcomes and foster a vibrant, inclusive, open, and engaged research community.

4 ENGAGEMENT OF AND INTERACTION WITH SESSION PARTICIPANTS

The workshop was designed to be highly interactive, with multiple opportunities for participants to engage with the content and each other. The following plan was constructed to facilitate this engagement:

1. **Introduction to the Workshop and Reading Club:** The session will begin with an overview of the workshop itself, but also of the subsequent reading club, explaining its purpose, structure, and the benefits of participation. This will set the stage for the activities to follow and help participants understand the context of the workshop.

2. **Chapter presentation by Jenni Case:** Following the introduction, Jenni Case, one of the authors of the seventh chapter of the "International Handbook of Engineering Education Research" (Johri, 2023), will present the

chapter “The Role and Use of Theory in Engineering Education Research”. This presentation will be guided by leading questions, providing a structured approach to exploring the content.

3. **Interactive Discussion**: After the presentation, participants will break into small groups for an interactive discussion. Each group will be given a set of questions to guide their discussion, encouraging deep engagement with the material presented.
4. **Co-Designing Future Sessions**: The final part of the workshop will focus on co-designing the subsequent online reading club sessions. Participants will be invited to share their ideas and suggestions for the format and content of these sessions, ensuring that they are tailored to the needs and interests of the group.

This structure ensures that participants are not just passive recipients of information, but active contributors to the learning process. We anticipated that this level of engagement will enhance the learning outcomes of the workshop and foster a sense of community among participants, and engage the authors for the future reading club sessions as well.

5 TAKE HOME MESSAGES

The intention was that participants will depart from the session feeling a sense of support from the SEFI community, coupled with an enriched understanding of the latest developments in engineering education research. The session was designed to provide an opportunity to interact not only with one of the authors of the Handbook of Engineering Education, but also with other members of the engineering education research community.

Their active involvement in shaping the structure of future reading clubs will foster a sense of ownership and commitment, thereby encouraging continued engagement in upcoming SEFI@Work sessions and the broader SEFI community. This experience is designed to empower participants, making them integral contributors to the evolution of SEFI and the field of engineering education research.

As **organizers** we hoped to gain:

1. **Feedback for Future Sessions:** The workshop provides valuable feedback for the organization of future reading club sessions. The co-design approach ensures that these sessions are tailored to the needs and interests of the participants.
2. **Understanding of Participant Needs:** The interactive nature of the workshop provides insights into the needs and interests of the participants, informing future content and format decisions.
3. **Successful Launch of the Reading Club:** The workshop serves as a successful launch of the reading club, setting the stage for a year of collaborative learning and community building.

In conclusion, both participants and organizers expected to take away valuable insights and experiences from the workshop. The reading club represents a response to the challenges of navigating the complex field of engineering education research. It leverages the power of community and collaboration to enhance learning outcomes and foster a vibrant and engaged research community.

6 CONTRIBUTION TO ENGINEERING EDUCATION

This workshop and reading club were designed to not only enhance the knowledge of the engineering education research community but also to foster a sense of community and collaboration. We believe that through shared learning and discussion, we can advance the field of engineering education research together.

7 RESULTS AND LEARNING FROM THE WORKSHOP

The Reading club was successfully launched with the introduction of the chapter on "The role and use of theory in Engineering Education Research" and a follow-up discussion led by two of the authors of the chapter present; Jenni Case and Aditya Johri. The discussion provided the opportunity for participants to consider the role of theory and its use in their own research as well as their own positioning (are researchers) in relation to relevant theories associated to their work.

The main take-home message from the discussion session on the chapter were:

- Theory is a lens through which we explore/observe/analyse the real-world phenomena that are the focus for a study.
- Theories do not necessary reconcile, it is necessary to be able to justify your choices of theory ("It is a big swamp").
- Theory, empirical data and methodology need to be revisited quite often in a cyclical way, it is not a linear process.
- Learning to use theory is not easy, especially coming from a engineering background. Resources such as the chapter are valuable to get started.

Participants also had the opportunity to provide their views and co-create the upcoming SEFI@Work session for the EER Reading Club to ensure that they are also inclusive to the broad SEFI community.

In the co-creation exercise participants were asked to share their views (preferences and potential pitfalls) on the sessions' format, duration, timing, frequency, topics, participant preparation, time for presentation, time for discussion, networking, interesting format to consider and any other thoughts on conducting the sessions.

Participants proposal for the SEFI@Work sessions are summarized below;

- Format: Interactive sessions where there is some level of structure in the discussion (rather than just open), where authors (a) provide insights of their own experiences and a view on motivations, theories or method(ologies) that they considered originally in their work but rejected (which are aspects that might not be included in the text), (b) ask the authors to so provide an outlook on future research trends and current issues on the topic or generally in EER and, (c) provide clear links to or examples of practice.
- Duration: 1-2 h with minimum of 1h and maximum of 2h.

- Time: Consider time difference that might prevent participants in different time zones to engage with the sessions.
- Frequency: Monthly, perhaps on a regular slot.
- Topics: New and seminal work on key topics, engineering creativity, design ability development.
- Participant preparation: Reading could be done before the meeting and questions could be shared with participants ahead of the session to enable early preparation.
- Structure of session: Preference for first a short re-cap of the chapter/article by authors followed by examples and applications, an exercise for participants to use/apply concepts/points presented and then general discussion, finally closing with a take-home message and/or a short summary. Mixed plenary and group tasks/discussions through breakout rooms.
- Networking: offer also a short time for people to share their own work within the session.

Other suggestions are:

- Having smaller and more frequent activities online.
- Advertising sessions early to provide long-lead time to book.
- Making slots for morning coffee online.
- Setting ‘Skill clinics’ to learn about methods and to get peer-support.
- Setting ‘Match-making’ meetings on topics such as research, funding calls, special courses.
- Setting opportunities to discuss topical issues ad-hoc.
- Having a channel for sharing information, for instance; tips, links and seeking advice about research.

Conference Key Areas*: The attractiveness of engineering education; Diversity, equity and inclusion in our universities and in our teaching.*
Keywords*: attractiveness, outreach, pathways, recruitment; schools*

ABSTRACT

Outreach initiatives play a pivotal role in attracting the next generation of engineers. Both academic engineering education institutions and employers engage in various outreach activities to illustrate what engineering entails and to demonstrate the impact of engineering to young children and adolescents. Despite substantial investment of time and resources, there is a lack of comprehensive documentation on the design, content, implementation, and impact of these interventions. This gap hinders the sharing of good practices and raises concerns about the efficiency of these efforts. This workshop aims to showcase diverse outreach activities and gather best practices on outreach activities and evaluation.

1 INTRODUCTION

The shortage of engineers has led to significant investment in outreach activities to encourage children and adolescents to pursue engineering. These interventions vary in aims, forms, target age groups, and contexts (e.g., curricular, or non-curricular), making it challenging to identify successful factors and of good practices. However, better insights into these factors would aid in replicating or designing activities in other contexts and benefit studies on outreach effectiveness, an aspect that is currently underreported in literature.

This paper discusses a workshop at the SEFI Conference 2024 in Lausanne, addressing gaps in understanding engineering outreach. The workshop builds on an ongoing systematic literature review by members of the SEFI Attractiveness SIG, investigating peer-reviewed articles on the effectiveness of in- and out-of-school engineering outreach activities.

2 OUTREACH, A BROAD RANGE OF ACTIVITIES

Preliminary results from ongoing literature research on outreach activities for secondary education (12-18 years old) reflect the wide variety of STEM outreach activities. Different factors influencing the development and organisation of outreach activities are identified.

Firstly, while increasing STEM attractiveness is the primary goal, the activities have varied purposes, such as increasing pupils' motivation and achievement in specific subjects like physics or increasing interest through engineering design challenges. Some activities aim to influence the attitude towards STEM and STEM careers by focusing on the societal impacts like sustainability or climate actions.

Secondly, activities can be offered in school as part of the curriculum (in a specific course, integrating different STEM courses, or in an overall school project), as extracurricular (voluntary lunch or after school activities), or as out-of-school activities.

Thirdly, target groups vary from all pupils to specific groups like girls or broader environments like parents or teachers. Fourthly, many activities involve different stakeholders, such as communal organisations or companies. Fifthly, time and cost investment are significant factors. Lastly, the impact and effectiveness of the outreach activities are often unclear, with few reporting on these aspects

The following three examples illustrate the diversity in purpose and design of such activities:

The Original Brush monster – an example of activity that anyone can do

The Brush Monster Challenge (UK) (1h) aims to provide a creative, practical and fun learning experience for children ages ten to fourteen years old. The activity is a good example of an activity that anyone can do. The resources required are limited: a small motor, a switch, an AA 1.5V battery, and a hand-brush. Each child constructs a simple electric circuit to power the motor, attaching the wiring loom to the brush using cable ties, switching on, and testing that their brush can shuffle across a flat smooth surface. The children can decorate their moving brushes with any available materials, creating the 'brush monster, which is easily customised to various occasions e.g. festive periods, harvest, etc. The activity is fun and engaging where the children get great enjoyment seeing their creations moving around the floor, with a multiplier effect when children bring their creations home. Its impact is not formally assessed.

Dutch Smart City Challenge – an example of collaboration and engagement

The Dutch Smart City Challenge aims to encourage all-age students' interest in STEM through a 14-week long series of out-of-school workshops, aimed at learning and collaborating on building GPS trackers. This activity is an example of collaboration and engagement within the local community and its Smart City initiative, which empowers students to help build their own community leveraging science, engineering and technology. The Smart City Challenge is thus a combination of STEM outreach and citizen engagement. The challenge has met its goal, i.e. to get more students interested in STEM subjects and change their perception of engineering from "boring and difficult" to "fun and meaningful". There is no formal assessment or evaluation for the outcomes and effectiveness of the Challenge initiative.

The engineering world, more than meets the eye – an example of interdisciplinarity and effectiveness

This intervention aims to broaden pupils' image of engineering and make them aware of the societal impact in Belgium. During an interactive workshop (1-2h), last-year secondary education pupils learn about diverse career possibilities and significant societal impact of engineering through activities. For example, pupils explore different engineering roles using the PREFER model (Craps et al., 2021). They discuss societal problems in chosen domains (healthcare, transportation, etc.), identifying necessary professions for tackling future challenges and the role of engineers therein, and emphasizing the collaborative nature and importance of engineering. Using a control-experimental group design, the effectiveness of the intervention was assessed by surveying pupils' image of engineering, sense of belonging in engineering, and engineering identity, including their interest in engineering.

The STEM community would benefit from (1) active sharing of good (and less good) outreach practices and experiences and (2) support in valid measurements and tools to evaluate the effectiveness of outreach activities. Through a systematic literature review, the SEFI SIG Attractiveness aims to contribute to this gap. However, a large number of activities are not published. Hence, the SEFI workshop is an additional step to contribute to the exchange of knowledge and experiences of practices.

3 METHOD

Upon entering, participants (n=27) chose tables for informal group discussions, facilitated by SIG members. The workshop started with sharing the three inspirational examples presented above. Two activity sheets were provided to enhance participation and idea exchange.

Round 1 focused on activity descriptions. Participants individually reflected on an outreach activity from their context (university, organisation or company) using the first activity sheet and presented it in groups, discussing aims, target groups, topics, and formats. Commonalities and unique approaches were explored.

Round 2 focused on activity evaluation. Participants used a second activity sheet to discuss whether the effectiveness of their activities was formally evaluated, including (possible) measurements and outcomes. Inspiring approaches and areas for improvement were identified.

In the final round, SIG facilitators shared each group's main observations and ideas with the audience. The completed activity sheets and facilitator notes were collected for analysis, excluding data from one participant who did not consent to its use. The data can be found in an excel file.

4 RESULTS AND DISCUSSION

4.1 Outreach activity description

- ***Activity purpose***

Outreach activities were categorized into four inductively created **main categories**:

- General interest in engineering (n=8)
- Subject-specific focus (n=8)
- Social challenges and sustainability (n=6)
- Promoting girls and women in technology (n=4)

Most activities aimed to **promote general interest in engineering**. All of the 26 interventions are subordinate to this overall objective, but specifically eight interventions described the aim to raise general awareness of the field of engineering, dispelling misconceptions and showcasing career opportunities. Examples include the *"Scientific Festival,"* which introduces practical engineering application in a fun way to a broad audience.

Eight activities focused on **specific engineering disciplines**, providing fun and creative hands-on experiences in subject-related activities like as robotics (n=4), mechanical engineering (n=2), data science (n=2) and microfabrication (n=1). For example, the *"Dancing Oobleck"* workshop teaches fluid mechanics through interactive demonstrations (how certain fluids, e.g. oobleck, can behave unpredictably under different conditions).

Six activities addressed **ssocial challenges and sustainability**, highlighting engineering's role in solving social and sustainability problems like the Sustainable Development Goals (SDGs) and engineering skills can have a direct impact (Beagon et al. 2023). The *"Engineering our health"* five-day summer programme introduces students to healthcare engineering, raises awareness of the challenges in healthcare and of engineers' contribution in improving public health and people's quality of life.

Four activities aimed to **increase the participation of girls and women in engineering**, using role models and confidence-building exercises. The *"Build a bridge competition"* helps young women gain practical engineering experiences and confidence in a supportive environment.

It should be critically noted that various activities could be assigned to more than one overall category. A limitation of the workshop analyses is that knowledge about the individual activities is limited in some cases, which is why the categorisation could possibly yield different results with more information.

Target groups

As illustrated in Figure 1, most interventions (64%) targeted pupils, with a small proportion (11%) targeting parents, despite their significant influence on the choice to study engineering (Gille et al. 2021) or on the career choice (Cho et al. 2008). Other target groups included teachers, university students, and people from lower socio-economic background.

As shown in Figure 2, primary (6-12 years) and late secondary (15-18 years) school students are well represented, but early secondary school students (12-15 years) were underrepresented (4%). This is notable as this age group is highly receptive to new learning experiences. These learning experiences could strongly influence their decision to study STEM (Buchor et al., 2014).

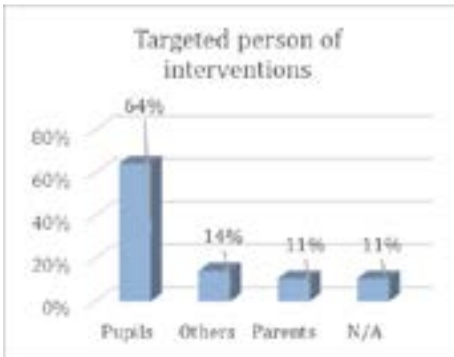

Figure 1: Target groups

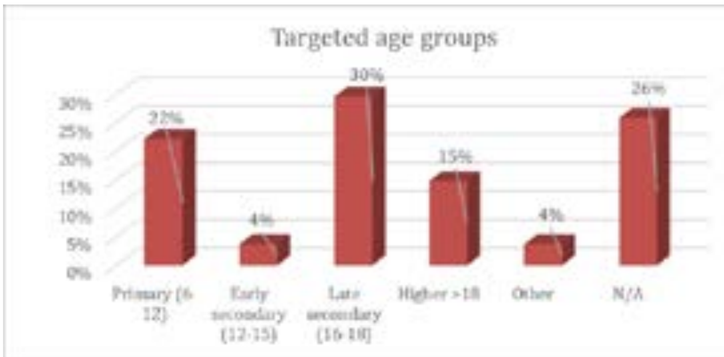

Figure 2: Targeted age groups of interventions N/A was used when the targeted age range spanned several age categories. Other' was used for activities targeting children and parents.

Place and format

Most interventions (56%) took place outside of school (Figure 3), requiring additional effort and resources (e.g., cost of travel or accommodation) but offering opportunities to meet "inspiring allies (role models, career paths)" or peers from other schools. One third (33%) occurred in schools, a familiar learning environment facilitating organisation and feasibility with limited resources.

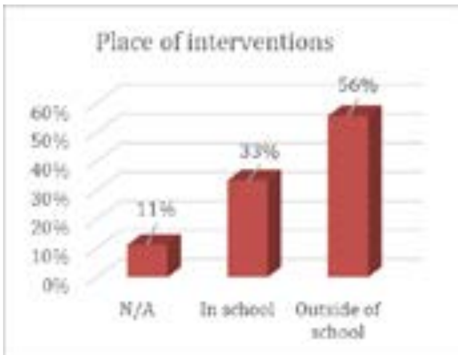

Figure 3: Place of intervention

Intervention formats varied from two-hour sessions to 7-10 days programmes. Most were 1.5 to 2 hours long, with some half-day sessions. Only two interventions were online, highlighting the preference for in-person participation, though online formats could improve inclusion for disadvantaged or remote participants.

4.2 Outreach activity evaluation

Of the 26 activities, 14 were formally evaluated, with results published in journals (n=3) or conference proceedings (n=4). Thirteen reported positive outcomes, while one participant noted positive results for an unevaluated activity. The effectiveness of the remaining activities was undetermined.

Evaluation methods included surveys (in pre-post or post-only), self-evaluation, knowledge tests, skills assessment, qualitative discussions, reflections, and grading. However, details on concrete measures, such as validated questionnaires, were limited.

Discussion highlighted challenges in evaluating outreach effectiveness. While measurable results, liked increased STEM enrolments may take years to manifest, some participants stressed the need for more data collection and improved evaluation methods. The difficulty of obtaining ethics approval for such studies was acknowledged. Additionally, measuring the effectiveness of activities aimed at families and parents versus those for children and teachers is challenging due to varying private settings and circumstances.

5 SUMMARY AND TAKEAWAYS

Significant resources are invested in mostly in-person outreach initiatives. Workshop results confirm the preliminary findings from the systematic literature review: outreach activities vary in purpose, target groups, and formats. While roughly half of the activities were evaluated, the measures used varied widely, and validated measures were not explicitly reported on the activity sheets. The SIG aims to summarise existing literature on engineering outreach effectiveness to inspire the community with appropriate research designs and validated instruments for better effectiveness assessment.

WHO IS THE BEST ENGINEER?: IDENTITY THEORY AS A FRAMEWORK TO REFLECT ON OUR ROLE IN THE CONSTRUCTION OF BELIEFS ABOUT THE VALUE OF SOCIAL RESPONSIBILITY IN ENGINEERING

Conference Key Areas: *1) Building the capacity and strengthening the educational competences of engineering educators, 2) Teaching social and human sciences to engineering and science students*
Keywords: *identity, research-to-practice, cultural construction, values*

ABSTRACT

The 2024 SEFI conference posed the question, "*How can we ensure the highest quality of technical competence while at the same time ensuring that social and environmental responsibility is core to the identity of engineering graduates?*" Identity formation is a complex process that has been theorized in many ways. In this workshop, I invited participants to consider Holland and colleagues' theory of identity as a useful framework for reflecting on our how our participation in engineering education contributes to beliefs about what makes a "real" or the "best" engineer. This theory posits that within our classrooms, students are participating in a complex cultural practice through which they ultimately learn to identify (and be identified) as more or less of an engineer than others. Our everyday classroom practices ultimately function to co-construct 1) shared beliefs about what makes a "good" engineer, and 2) everyone's relative position in a social hierarchy. Furthermore, identify development is theorized to include both social forces (i.e., rules and guidelines that influence how people behave in a social space) and individual agency (i.e., we are not just carbon copies of culture or norms because our actions shape the culture and norms). Understanding identity development as such empowers us to be intentional with our own participation in identity construction by providing theoretical entry points for conveying the value of social responsibility. The usefulness of this particular identity theory to ideate strategies for integrating social responsibility into students' engineering identities has been corroborated by the

[1]*E. Dringenberg*
Dringenberg.1@osu.edu

empirical findings of our U.S.-based engineering education research. During this workshop, we utilized the theory to draw out existing or future concrete practices that each of us, given our unique global and institutional contexts, are motivated to enact in support of social responsibility as core to engineering. Specifically, our interactions culminated with answering the following question: What is one concrete way I can *be intentional* in how I participate in identity co-construction? Participant responses to this prompt are presented directly.

1 INTRODUCTION

1.1 What were session participants expected to learn?

I designed the workshop to achieve the following learning outcomes:

Participants will be able to…

1. Recognize identity as part of a complex social process
2. Reflect on their participation in this social process
3. Generate at least one concrete way to *be intentional* in how they participate

1.2 What made the session relevant and attractive for the audience?

This session was relevant and attractive for the audience because it presented Holland and colleague's theorization of identity (1998) as a framework for reflecting on the ways in which we all play an active role in the complex social process through which students learn to understand them as engineers (or not). More specifically, this theorization of identity acknowledges the complex and interrelated nature of individual agency and the broader social context. The idea is that in any given classroom context, there are rules, guidelines, and social forces that influence (but don't dictate) how people behave, speak and conduct practice within social spaces. We are all subject to the greater power structures around us, and at the same time, we have agency to resist and re-shape these norms. At the end of the day, this identity theory assumes that we are participating, along with the students and others in engineering classrooms, in a complex social process through which we co-construct shared beliefs about what it means to be an engineer and everyone's relative position in a social hierarchy. Therefore, it is through intentional and theory-based action that we can work to integrate social responsibility, or other values, into the very definition of an engineer that students are learning to identify with. Given the theme of the conference, this session was useful for any conference attendee willing to critically reflect on how their own role in engineering education fosters or counters the belief that social responsibility is core to being an engineer.

1.3 How was this work significant for engineering education?

This type of workshop was significant for engineering education because it challenged us to move beyond espousing the value of social responsibility and lean into our agency as part of the cultural production of the very characteristics that are recognized as necessary to be a good engineer. The workshop provided attendees with the opportunity to reflect on the implicit and culturally specific ways in which their own educational praxis is a local site for the co-construction of students' engineering identities. By framing engineering identity as the outcome of a cultural practice, we were prompted to generate theoretically- and empirically-based modifications to our own actions that shift culture from the ground up.

This effort was also significant for engineering education because it is a translation of research to practice. We have significant empirical findings from our research on student beliefs and identities as engineers and as smart that justify the use of this theory to guide the workshop. During the workshop, I justified our use of this framework by briefly sharing highlights of our U.S.-based research findings that corroborate the theory. These findings include: identifying as smart is a fundamental way that students identify as a "good" engineer (A. Kramer et al. 2019; Wallwey et al. 2024); as students transition from a pre-college to a college context, they are actively constructing their identities as "smart enough" for engineering (Kajfez Under Review); students articulate 11 distinct ways that they believe one can behave like a "smart" engineer (Amy Kramer, Kajfez, and Dringenberg 2024); understanding oneself as an engineer is a process of social comparison (Dringenberg, Kramer, and Betz 2022); behaviours related to social responsibility are valued more by students personally than by what they experience in engineering classrooms (with statistical significance) (Amy Kramer, Kajfez, and Dringenberg 2024). In addition, researchers have used Holland and colleagues' framework to study the complex process of engineering identity across contexts of construction engineering in Sweden (Gonsalves et al. 2019) and engineering design in the U.S. (Tonso 2007).

2 METHODOLOGY

2.1 How were session participants activated?

<u>Survey item to assess control beliefs in the room</u>

As participants arrived, they were invited to provide a "pre" response to the following question in a Likert-scale style (1-5 strongly disagree to strongly agree) poll: *I am capable of promoting social responsibility as required to identify as an engineer*.

<u>Overview of workshop</u>

Next, I presented the conference theme (How can we ensure the highest quality of technical competence while at the same time ensuring that social and environmental responsibility is core to the identity of engineering graduates?) and introduced myself by way of my focus on the "core to the identity" bit of this theme for the workshop. I also presented the learning outcomes and corresponding workshop plan to participants.

<u>Introduction of Holland's identity theory and U.S.-based research findings</u>

I provided a brief overview of and justification for the identity theory that I draw on (Holland et al. 1998) when thinking about how we might shift or expand the behaviours that are constructed as necessary to be recognized as a "good" engineer in the context of higher education. As multiple identity scholars were present in the room, we had a lively discussion about multiple facets of this complex theory. I introduced Table 1, which contained three theoretically-grounded entry points for us, as participants in engineering spaces, to influence the co-construction of shared beliefs about what makes a "good" engineer. The second column provides more concrete and detailed components of our classrooms. One participant provided feedback that yet another column to provide further concrete examples would be helpful in future work, with which I agree.

Table 1. Theoretical Entry Points for Practice

We co-construct what is believed to make a "good" engineer in…	**And can therefore be intentional about the values communicated via…**
1. How we design and implement our course	• The learning outcomes we establish for our courses • Which outcomes we prioritize and assess • Our methods of assessment • The discourse within our classrooms • The content of course artifacts
2. The extent to which we understand and name the socio-historical-cultural forces of our context	• The history and culture of our educational context • The cultural landscape of engineering • The behaviours that are rewarded in our classrooms • The expertise that is modelled by our teaching team • The expectation (or not) that engineering education develops students' critical consciousness
3. The extent to which we learn and integrate students' values into our classroom praxis	• How we situate students in our classrooms with respect to knowledge production • The extent to which we work to understand students' values and motivation • The extent to which we are willing to share power with students when it comes to classroom practices

<u>Reflection and discussion to ideate best practices and synthesize insights</u>

Next, participants were invited to first reflect individually and then discuss with others their own ideas (current or future) for how they could be intentional in their participation in co-construction of student identity. We came back together as a group to share out, and the participants exchanged ideas.

<u>Debrief and closing (10 min)</u>

I closed by asking participants to write down at least one action that they are willing to commit to on a sticky note. Additionally, they were invited to respond to the same Likert-style survey question we started with (control beliefs) and provide a free response to the prompt, "Describe one concrete way you'll be intentional in how you participate in identity co-construction."

3 RESULTS

3.1 Pre and Post survey item results

The responses to the pre and post survey item on control beliefs are displayed in Figure 1.

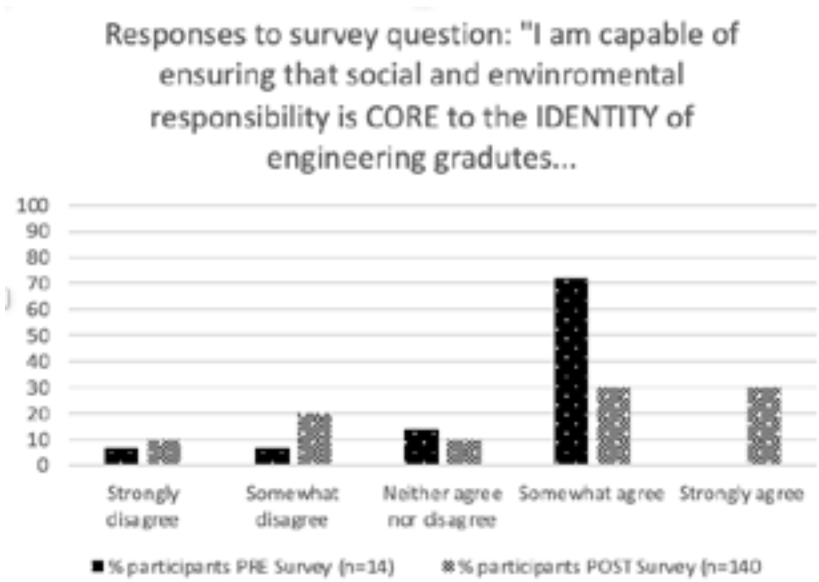

Figure 1. Survey item pre and post responses

A general observation here is that from the beginning to end of the workshop, the bulk of attendees went from "somewhat agree" to split between "somewhat agree and strongly agree," which I found encouraging. No statistics were performed as this was not a formal evaluation plan. As for the open responses, the following bullet point list captures the responses generated by participants, edited only for readability:

- Create awareness of students' own identity → values, perspectives, biases
- Make conversations on identity and perceptions a part of the classroom discourse
- Consider course artifacts as a part of the classroom design and assignments, and as a form of representation (include images that are inclusive)
- When I get students to make up an optimization problem and present the answer for peer-review, I should get them to choose a problem personally important to them and explain to others why it is important to them
- Make students aware of the notion of professional identity which is done/performed through skill demonstration (that they are not just "students")…then they recognize we "become" an engineer when practicing
- Give thought provoking assignments—ask students what kind of engineer do they want to be (instead of what they are expected to be)
- Support student collaboration in problem/practice based educational assignments
- Consider not just student identity, but also teacher identity
- Consider the pressures to conform to "figured world norms"
- Consider how to align student and other values
- Give students the tools to help them become aware of the figured world and how to interpret these artifacts/dialogues
- Didactic contract to be explicit in expectations between student & teacher to build student/teacher/class shared norms & values in class which then shapes identity via building of sense of belonging & self-efficacy
- Tell the students the learning possibility of failing
- Suggest faculty-student tandems for developing sustainability teaching to my university

- Consider classroom discourse and modelling diverse expertise in the teaching team.
- Ask students why the course is important to them and how it aligns with their professional and social values
- Provide more artifacts and discourse in my classes on this topic.

Finally, I sent a draft of this paper with attendees who indicated an interest in seeing the paper and solicited their edits or feedback before submitting the final version for publication. No edits were requested.

4 SUMMARY AND ACKNOWLEDGEMENTS

I would like to acknowledge my close collaborators on the work that informed my thinking for this workshop implementation: Drs. Rachel Kajfez and Amy Kramer.

***Conference Key Areas**: Fostering Engineering Education Research*
***Keywords**: Engineering Education Research, Journal, Peer review, Reviewer, Editorial process*

ABSTRACT

This workshop focuses on peer review of journal manuscripts in the field of engineering education research. The aim is to jointly consider how to review manuscripts fairly, constructively and effectively. To this workshop we invite both experienced and new reviewers, with a particularly warm welcome extended to doctoral students in engineering education research.

1 BACKGROUND: FAIR, CONSTRUCTIVE, AND EFFECTIVE REVIEWING

1.1 Peer review as a way to safeguard and enhance quality

The function of the peer review process is first to support journal editors in making *fair* decisions by helping them identify which manuscripts deserve to be published. The task is further to *constructively* support the authors in improving their manuscript before publication. The peer review process often goes through some iteration to help authors improve their research ideas and approaches, as well as how they communicate these ideas, methodologies and results to the readers. It is through this process of both selection and enhancement that the quality of publications is safeguarded. By extension, this is how the whole research field can establish and maintain respect. Reviewers therefore play a vital role. It is even fair to say that without peer review there can be no respectable field.

1.2 The work of reviewing

Given that the research field depends on it, reviewing manuscripts is a contribution that all scholars need to make to sustain and further the field. The peer reviewer role is also a part of any academic identity and expresses scholarly collegiality. In addition to such altruistic reasons, it is a rewarding task to review manuscripts, since much can be learned from engaging with the work of others. It is not least helpful to experience the editorial process from the inside. Such insights can be helpful when taking one's own manuscripts from submission to successful publication. However, as reviewing can also be time-consuming, it is a wise investment to improve one's skills to do it *effectively*.

2 ABOUT THE WORKSHOP

2.1 Aims

The workshop aim was to introduce the participants to various credible journals in our field, with their different aims and scope, and review criteria.

During the group exercise, participants were asked to consider the following aspects:

- The roles and perspectives of authors, editors, and reviewers in the peer review process
- How to provide recommendations to support editors in making fair decisions
- How to provide constructive suggestions to authors to support them in improving their manuscripts
- Which aspects of a manuscript that are helpful to focus on in a review, and how to apply the review criteria
- Ethical aspects of peer reviewing – do's and don'ts
- Time management strategies for effectively producing articulate reviews

2.2 Outline

The total duration of the workshop was 60 minutes.

Brief introductions

- Participants and session leaders.
- Journals: aims and scope, review criteria and review process.

Group activity

- Participants were divided into groups of about four, each facilitated by one or more journal editors. The task was to make a virtual poster: "Advice for reviewers". The poster consisted of a slide in an online collaborate writing environment. All participants wrote concurrently during the discussion, without needing to reach full consensus.

Plenary

- Joint discussion about the results – in search for synthesis, collected wisdom and conclusions.

Closing

- At the end, participants were invited to sign up to receive documentation from the session, including the posters that were produced during the workshop. They could also sign up to volunteer as reviewers for the journals.

2.3 Facilitators

The workshop was facilitated by a large team of editors of five leading engineering education journals:

- *European Journal of Engineering Education (published by SEFI)*
- *Journal of Engineering Education (published by ASEE)*
- *Australasian Journal of Engineering Education (published by AAEE)*
- *IEEE Transactions on Education (published by IEEE)*
- *SEFI Journal of Engineering Education Advancement (published by SEFI)*.

3 RESULTS FROM THE WORKSHOP

During the workshop 22 persons worked intensely, in 4 groups, to generate advice for reviewers. The posters that they produced are copied below, slightly edited.

3.1 Group 1

- Put yourself in the shoes of the authors and the readers
- Can you understand the paper even if you're not an expert?
- Don't talk about what you would write; discuss what you would read
- You are not reviewing the author; you are reviewing the paper
- Longer reviews don't necessarily mean better reviews
- 3-4 actionable bullet points are better both for the author and the editor
- Structure your review: what are the main points, and what are minor fixes?
- Give examples (e.g., where is the alignment off?)
- Highlight the positive/strong aspects: This helps us to keep the good aspects when reviewing the paper
- Helps the editor
- Be careful with the use of AI
- Don't put the paper you are reviewing into AI, although GenAI may be used for structuring your review
- Name-dropping is to be avoided
- Don't push citing your work as a reviewer
- Make sure that what you cite is what you say
- Notify editors about possible delays:

- If you know you will be busy in advance already, talk to the editor about your timeline
- If you can't do it, say it as soon as possible
- As a reviewer, you are not correcting – you are making suggestions and advising the author (and the editor)
- You are not the writer
- You are not alone
- Editors and associate editors are also reviewing, especially if the reviewers don't agree
- Reviewing is a way to grow as a part of the community
- You can improve clarity, but novelty is difficult to add
- Even if you reject, provide suggestions as to what can be improved, e.g., "these are necessary," and "these would add value"

3.2 Group 2

- Be constructive in offering ways to improve the work proposed
- Be respectful in a sense of providing peer-to-peer education
- Be concrete on your suggestions
- Provide references when you feel they would be helpful

  Be aware of your own biases; be impartial and non-biased regarding your own research
- It is fine if you make your review only on your line of expertise, you don't need to be an expert on all elements of a paper: give feedback on what you know well enough only (editors will have the role to combine reviewers expertise into one paper revision);
- Be honest about the paper's contribution to the field; let the authors/editors know the relevant already existent publications
- If you notice a review is taking a lot of time, park it for a bit, and try again a few days later

3.3 Group 3

-
- Read the paper, the first time for context and feel, and then reread for detail
- Assess if you can gist the paper from abstract, figures and conclusions
- Give advice that is actionable
- Give realistic Advice, e.g., Don't ask "for more data" (unless the paper is unpublishable without expansion)
- Advise, don't criticise

- Do not proofread
- Be timely
- Is the usefulness of work clearly defined?
- Don't be a gatekeeper
- Be supportive…

3.4 Group 4

- Focus on the key issues - not pages on listing typos
- Be constructive and empathetic. Authors often don't spell out what they've done clearly enough because they're very close to the work. Don't just talk about the things that were done poorly, also highlight what's been done well.
- Write the review in a tone you would want to receive
- Recognize that authors own an interpretivist view of their research
- Use the confidential comments box to be candid (i.e., fit for the journal, citation of literature relevant to the area of study overlooked)
- Consider if the paper has 'potential' and offer suggestions for how to move the paper forward in a productive manner (similar to offering actionable feedback)

4 CONCLUSIONS

The advice for reviewers reflects several common themes. The groups have much to say about what it means for reviews to be *constructive*, in the sense of being directly helpful to the authors to improve the manuscript. In particular, actionable and concrete advice is much valued. Structuring a review by distinguishing between fundamental or serious issues and optional recommendations is also helpful, both to editors and authors. Suggesting relevant references is helpful, but not to promote one's own work. You may highlight very relevant work of your own in the confidential advice to the editors, so the editors can determine its relevance and usefulness to the manuscript and include the suggestion in the editor's comments. Another theme related to *fairness* is the advice to see the manuscript on its own terms. We are reminded to consider the manuscript as the authors' work rather than what the reviewer would have written. Generally, reviewers should understand the role of their own positionality and possible bias. An important theme is *empathy*. A review must be worded in a respectful tone. Highlighting what is good about the manuscripts is recommended, not only for balancing the critique to make the review easier to bear for the authors, but the validation of strengths is important information for both editors and authors. Empathy and respect are also conveyed by helpfulness. A truly supportive review is when the reviewer not only points out weaknesses in the manuscript, but also gives advice on how to overcome problems. As one group pointed out, manuscript reviewing is also *peer-to-peer education*. Approaching the peer-review role with that mindset makes reviewing a valuable contribution to the field.

5 ACKNOWLEDGEMENTS

The editors who facilitated this workshop would like to extend their sincere gratefulness to the reviewers who volunteer their time and effort to engage in the peer review process. Through these anonymous contributions, reviewers are supporting the journals, the authors, and the field of engineering education research.

Re-imagining engineering education through addressing interdisciplinary course design challenges

1 INTRODUCTION

There has been a shift in higher education as universities began to re-evaluate their teaching and learning to ensure that students are well-prepared for the global challenges. Especially in the field of engineering, future graduates are expected to address complex issues such as sustainability and consider the societal impact of their solutions (Hadgraft and Kolmos 2020). These expectations require engineers to collaborate effectively with others from different disciplines and backgrounds (Borrego et al. 2013). However, interdisciplinary collaboration and learning from different disciplines can introduce challenges, as team members often have vastly different perspectives, experiences, methodologies, and even different languages (Feng et al. 2023). This dynamic can be especially challenging for students who are accustomed to discipline-specific collaborations.

Universities have responded to this challenge by creating various opportunities for engineering students to engage in interdisciplinary collaboration projects. Internationally recognized frameworks and accreditations, such as the CDIO (Conceive – Design — Implement — Operate) framework (Crawley 2001) and ABET (Accrediting Board for Engineering and Technology 2021), highlight the critical role of multidisciplinary collaboration for engineers.

Despite these initiatives, developing and implementing courses that integrate multiple disciplinary perspectives remains a challenge for educators. Research indicates a need for pedagogical training in course design to help educators navigate the complexities of interdisciplinary projects and ensuring that students receive appropriate support (Kjellberg et al. 2023; Van den Beemt et al. 2020; O'Connell et al. 2023). Therefore, this workshop aims to assist educators in designing multi-, inter, and transdisciplinary courses that leverage available resources and align course design with intended learning outcomes, effectively preparing students for their future roles in addressing societal challenges. We introduce a toolkit that can be utilized by all engineering educators regardless of their expertise. Novice engineering educators will find the toolkit an accessible starting point for designing multi-/inter-/transdisciplinary courses, while seasoned educators can use it to explore new aspects in their course designs.

2 RATIONALE

Interdisciplinary courses can take various forms, such as incorporating students from diverse backgrounds, introducing interdisciplinary problems or projects, or involving non-academic stakeholders to collaborate with students (Feng et al. 2023). Navigating these characteristics of interdisciplinary teaching and learning is not straightforward. Hurdles have been found among teachers collaborating across different departments and schools (Dym et al. 2005; Feng and Hölttä-Otto 2021). Engineering educators often struggle with how to optimally use resources while balancing the need for disciplinary breadth against depth (Holt et al. 2017).

The aim of this workshop is twofold. First, it introduces a toolkit that provides a platform for engineering educators to re-imagine and co-create course designs for various multi-, inter-, and transdisciplinary teaching scenarios. Second, it offers an opportunity to test the course design toolkit presented in Figure 1, gathering insights for its further development to better meet engineering educators' needs. After the workshop, the participants are equipped to pilot the toolkit in their own course design and to facilitate course design workshops within their respective institutional contexts.

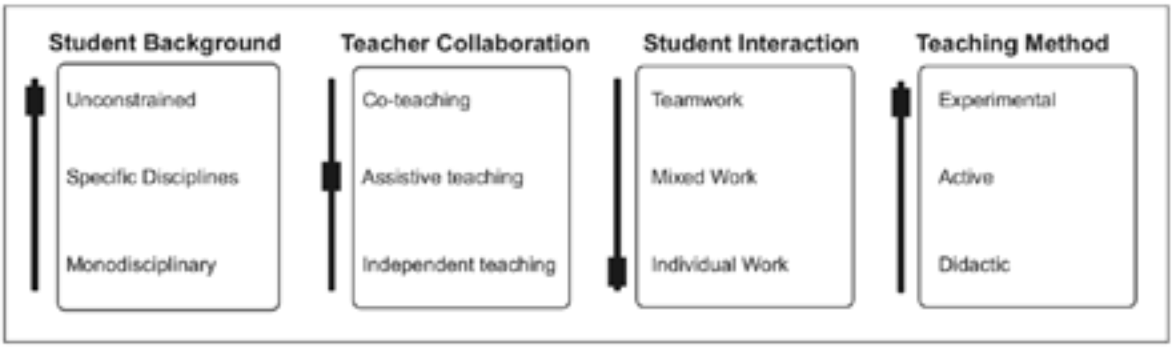

Fig 1. Multi-, inter-, transdisciplinary course design framework. The tool works like a mixing board with a slider; by finetuning the settings, course designers achieve an optimal outcome

In theorizing this workshop, we recognized various relevant terminologies of disciplinary integration, and distinguished between multidisciplinary, interdisciplinary, and transdisciplinary. A multidisciplinary course exposes students to various disciplinary perspectives, offering a broader view. An interdisciplinary course goes a step further by integrating different modes of thinking and methodologies from various disciplines. A transdisciplinary course transcends traditional academic boundaries by involving societal stakeholders in the co-creation of solutions (Lattuca et al. 2017; Klein 2015).

Building on a previously developed course design framework on multi-, inter-, transdisciplinary course design (Feng et al. 2023), the workshop covered four aspects (Figure 1):

- ***Student Background*** refers to the disciplinary backgrounds of the students participating in the course. Students may come from only one discipline, specific sets of disciplines, or any discipline.
- ***Teacher Collaboration*** relates to the mode of working among course teachers. Teacher(s) may teach alone or invite guest lecturers for assistance. Co-teaching represents the highest level of collaboration, including joint course design and teaching efforts throughout the course.
- ***Student Interaction*** pertains to the nature of students' work during the course, ranging from purely individual work, a mix of teamwork and independent tasks, to team-based work throughout the course.
- ***Teaching Method*** refers to method employed by the teacher. Didactic method involves traditional lectures, imparting knowledge to students; active learning method emphasizes experiential learning with, for example, Problem-Based Learning; experimental teaching adopts creative teaching methods, such as writing, drama, debates, role play, etc.

3 METHOD

The workshop was implemented as a course design challenge aimed for engineering educators of all experience levels. It was particularly appealing to those new to or with varying degrees of experience in interdisciplinary teaching who wish to explore the implications of their course designs more deeply. Structured as a 60-minute session, the workshop was comprised of three sections: a 15-minute introduction, a 30-minute group work activity, and a 15-minute conclusion.

First, the workshop provided the participants with an overview of the different aspects of course designs (Figure 1). Then, the participants worked in teams to solve course design challenges. The participant groups were given hand-outs to familiarize themselves with course scenarios and toolkit materials. In the workshop's final part, participants shared their designs and formulated their take-home messages.

The workshop provided several different course design challenges. Three course scenarios were provided, each included three course design challenges. Two to three participants worked together in each group to tackle one challenge. The exemplar course scenarios and challenges are introduced below in Table 1.

When designing their course, participants were asked to consider the four aspects described in the course design framework (Figure 1), which include student background, teacher collaboration, student interaction, and teaching pedagogy. They were also required to justify their course design considering the intended learning outcomes.

Table 1. Engineering course scenarios and design challenges

Course scenarios	**Course design challenges**		
	Multidisciplinary	Interdisciplinary	Transdisciplinary
1. Water governance course	Design a *multidisciplinary* water governance course	Design an *interdisciplinary* water governance course	Design a *transdisciplinary* water governance course
2. Product development course	Design a *multidisciplinary* product development course	Design an *interdisciplinary* product development course	Design a *transdisciplinary* product development course
3. Course on developing sustainable living spaces	Design a *multidisciplinary* course on sustainable living spaces	Design an *interdisciplinary* course on sustainable living spaces	Design a *transdisciplinary* course on sustainable living spaces

4 RESULT SYNTHESIS

There were approximately 25 faculty members who participated in the workshop. The participants collaborated in ten small groups of two or three persons in each. They were asked to tackle a course design challenge with an aim to create a multi-, inter-, or transdisciplinary course. The three given course design scenarios included product development, water governance, and sustainable space design. Once the ten small groups completed their designs, they merged into larger groups to compare and discuss each other's course designs. There were four larger groups, each comprising 4 to 9 participants, who engaged in these comparisons.

The comparisons between the groups revealed that while participants often adopted similar overall approaches to course design, the details and underlying rationales varied significantly. For example, both the multi- and transdisciplinary course design groups tailored their courses for students with specific disciplinary backgrounds, such as architecture, energy, and civil engineering. However, the transdisciplinary group extended their course to include more diverse students, such as sociology students, bringing a broader and more diverse range of perspectives than in the multidisciplinary group. Moreover, while both multi- and transdisciplinary groups incorporated guest lecturers from various disciplines as part of their assistive teaching strategies, the transdisciplinary groups also involved stakeholders, either as guest lecturers or as to provide real-world challenges for students to address. For interdisciplinary groups, their course designs emphasised more on the disciplinary integration regarding co-teaching and students' teamwork throughout the course.

5 SIGNIFICANCE

The workshop provided a valuable opportunity for engineering educators to reflect and collaborate on interdisciplinary course designs. As the current global challenges often demand interdisciplinary approaches, engineering educators are at the forefront of crafting educational experiences that span across disciplines. This workshop, by focusing on the intricacies of designing courses that accommodate diverse student backgrounds and interdisciplinary content, addressed a critical need within the academic community. It encouraged educators, regardless of their experience level with interdisciplinary teaching, to explore and critically evaluate the implications of their course designs. The importance of peer learning was also highlighted in the wrap-up discussion.

Through a structured exploration of course design aspects and tackling exemplary teaching challenges, participants were equipped with the tools and insights necessary to enhance their pedagogical strategies. This not only enriched the learning experience for students but also contributed to the broader goal of fostering a more integrated, holistic approach to engineering education. Through dialogue and sharing of course design ideas, this workshop can help shape the future of engineering education, making it more responsive to the needs of multidisciplinary students and ultimately, a rapidly evolving world.

6 ACKNOWLEDGEMENT

This work is supported by Maa- ja vesitekniikan tuki ry (MVTT), Finland, and by Tracks, a major educational reform initiative from Chalmers University of Technology, Sweden.

Conference Key Areas: *Engineering skills, professional skills, and transversal skills.*
Keywords: *Group work, teamwork, assessment, challenges, good practice*

ABSTRACT

The challenges, issues and concerns regarding the use and assessment of students group work have many commonalities across all engineering disciplines, as well as the methods used to address them. Hence, it is highly significant for the engineering community to discuss and share experiences. This workshop does this two-fold:

[1] *MP Garcia-Souto,*
p.garciasouto@ucl.ac.uk

i) Gets a diverse range of staff from a variety of engineering disciplines and institutions to reflect on, share and discuss in this workshop their practice to make the running and assessment of group work more successful;
ii) Gathers teamwork teaching experiences and common challenges across the sector when teaching teamwork and to start identifying methods and approaches for tackling these challenges.

This workshop is relevant to all those in engineering education using group work (instructors, curriculum designers, etc) regardless of their level of experience. Pre-workshop survey (optional): https://forms.office.com/e/6xzKt2GqA6

1 INTRODUCTION, MOTIVATION AND LEARNING OUTCOMES

Teamwork has become an intrinsic element of professional life regardless of the engineering field, allowing diverse and multidisciplinary or specialized teams to address more complex/bigger problems. The World Economic Forum's Future of Jobs Report consistently discusses the need for graduates to have a mix of professional skills, global competency, and technical knowledge (World Economic Forum, 2020). Active learning methods, such as project-based learning (PjBL), are the gold standard for teaching skills in a wide range of contexts (Kolb, 2015). Participating in group projects help students to develop their skills and ability to work in teams in a variety of scenarios, but also develop their technical skills and knowledge further. Consequently, now the use of teamwork activities is highly common in Engineering Higher Education (HE). However, running and assessing group work in any engineering discipline has its own challenges and has raised a range of concerns among students, staff, external examiners and professional bodies that perform external-led degree audits e.g. for accreditation purposes.

Riebe et al (2016) in their systematic review of various case studies, categorised challenges associated with delivering and assessing teamwork in HE context into two themes, i.e., teamwork pedagogy and transaction costs. Challenges associated with teamwork pedagogy include: (I) Instruction strategies, whereby educators and learners lack prior experience, view teamwork as an inefficient use of time and find moving away from tutor-centred teaching challenging (Holt et al, 1997), (II) Curriculum design – the degree to which team skills development is incidental or intentional in the curriculum, (III) Team composition, and (IV) Assessment.

Willamson's (1979) transaction cost theory assumes that engagement is a function of the benefits or costs derived from developing, coordinating, monitoring, participating in, interacting with, and evaluating teamwork pedagogy. Thus, challenges associated with truncation costs include, (I) meeting employer and accreditation body expectations, (II) tutors' readiness to develop resources, strategies and interventions for teaching teamwork, (III) learners' readiness and (IV) availability of institutional resources and focus.

The use of self - and/or peer assessment procedures including the implementation of online team tools to provide feedback on the effectiveness of team members have the potential to reduce the temporal and efficiency related costs (Delaney et al, 2013). This paper focuses on one such tool, the Individual Peer Assessment of Contribution to group work (IPAC), developed at University College London (Garcia-Souto et al, 2020). The application of this tool entails the tutor assessing and awarding a group mark to a group task completed by learners. The learners then assess the level of contributions of each of their peers, including themselves, from which an IPAC factor is generated after moderation by the tutor. This IPAC factor may then be applied formatively or summatively to generate individual marks for the group members. The IPAC assessment methodology has been seen to mitigate a number of the challenges and concerns typically observed by staff and students (Garcia-Souto, 2019, Seatwo A, 2019). UCL has developed an LTI that allows practitioners to implement this assessment methodology easily and time efficiently within their institutional virtual learning environment. The IPAC methodology and system are briefly presented, and attendees invited to try in their own institutions.

The leads of this workshop bring to the table their collective experiences of running 6 different case studies within the Integrated Engineering Programme (IEP) at University College London (UCL) - one of the most comprehensive and largest applications of active learning methodologies within undergraduate engineering curricula in the UK (Mitchell et al, 2019). The selected case studies, all of which use the IPAC methodology, provide a comprehensive representation of the journey the students take from year 1 to year 4, in different class sized (80 to 1000) and with projects of different length and weight towards the final degree classification. A series of challenges/concerns and also mitigations found by the authors (Garcia-Souto et al, 2024) were explored in the workshop.

A long-term potential outcome of this workshop is the identification of further methods that can support any academic in an engineering subject in any HE institution when planning/running group work.

2 BACKGROUND AND RATIONALE OF THE SESSION

The challenges faced by academic staff when implementing and assessing group work truly apply across engineering fields and educational institutions/universities. Yet, staff discussions of good practice and published literature typically (if not always) occur at “local” level and lack breath of disciplines and experiences.

This workshop is an excellent opportunity to discuss and reflect on experiences from a broad range of staff running teamwork activities in engineering education (covering as many case studies, engineering disciplines and institutions as possible) and to help to truly identify good practice across the sector. Analysis will then be done post-workshop to identify common challenges across the sector when teaching teamwork and to start identifying methods and approaches for tackling these challenges. An initial summary will be included in the workshop paper as part of the proceeding with the aim of a more comprehensive paper published later (register interest in the link provided in section 4). This is of relevance to the overall community of engineering educators across institutions, countries, engineering fields that currently run or plan on running group work within their modules or engineering degrees.

3 WORKSHOP STRUCTURE

The structure of the workshop is as follows:

- Introduction – the challenges of running and assessing group work (10 mins):

- Groups discussion - discuss current practice/possible process to address/mitigate challenges of group work (30 mins):
- Groups feedback moderated by workshop leads (10 mins)
- Presentation of the IPAC system/methodology used for the assessment of individual contribution to group work (3 mins)
- Summary of outcomes and closure (3 mins)

4 RESULTS FROM THE WORKSHOP

A total of 20 people from a variety of institutions attended this workshop and agreed to participate in the study (UCL Research Ethics Committee: Project ID number: 6257/003 – part1). They were asked to assess the prevalence and impact of a series of challenges as well as usefulness of various mitigations. Results are presented in tables 1 and 2 respectively. They were also encouraged to comment on additional challenges and mitigations.

Rating criteria: 0-Negligile; 1-Low; 2-Significant; 3-Very

Table 1. Assessment of prevalence and impact of various challenges when running group work.

Challenge	Prevalence			Impact		
	N	avg	SD	N	avg	SD
A. Uneven student contribution/engagement	15	2.2	0.6	14	2.4	0.8
B. Validity of assessment (Is assessment representative of contribution?	14	2.0	0.9	12	1.8	0.9
C. Diversity in the team (Potential conflict from differences in a team's experiences and background)	14	1.9	0.6	14	2.0	0.9
D. Teams with students requiring adjustments (due to disabilities or emergency circumstances)	10	1.1	0.6	11	1.1	0.9
E. Readiness of students to work in a team	14	1.6	1.0	14	1.8	1.0
F. Formation of teams	11	1.2	1.1	11	1.0	0.9
G. Team cohesion	13	2.0	0.7	13	1.9	0.6
H. Staff workload	11	2.4	0.8	12	2.4	0.7
I. Readiness of staff to teach teamwork	10	2.3	0.7	10	2.2	0.9

Table 2. Assessment of how useful were various mitigations when running group work.

Mitigations	Usefulness		
	N	avg	SD
1. Peer assessment of individual contribution (IPAC)	10	2.3	0.6
2. Training students on teamwork skills development	10	2.3	0.5

3. Check points with staff (e.g. IPAC, attendance…)	11	2.2	0.5
4. Team contract	11	0.8	0.8
5. Balance team formation (e.g. diversity, avoiding known conflicts)	10	1.9	1.1
6. Resilience in the projects (e.g. feasible even with a missing team member)	9	1.4	0.5
7. Staff resilience	10	1.8	0.8
8. Exceptional cases addressed/dealt/supported by staff	11	2.4	0.7
9. Staff training	7	2.4	0.5

Workshop participants reported experiencing to some extent all the challenges listed by the authors, although the prevalence and impact of each varied for each participant. Statistically, the challenges with larger prevalence and impact are *A-Uneven student contribution/engagement*, *H-Staff workload*; and *I-Readiness of staff to teach teamwork.* Participants also pointed out additional challenges, with the most common being “language barriers”, “lack of time management skills” or “students dropping out”.

Participants shown to have engaged with a number of the mitigations presented by the authors, but often just a subset. The mitigations that participants used and found most useful were *1-Peer assessment of individual contribution (IPAC); 2-Training students; 8-Staff addressing exceptional cases; and 9-Staff training*. In regards to the “student training”, participants felt compelled to list a series of examples of good mitigations or something that should be incorporated (e.g. self-reflection, teaching time management or conflict resolution), just stressing the importance of training. Some participants also suggested that student training should be done at programme level, with coordination between academics that run group work, which agrees with the approach used by the authors (Garcia-Souto et al, 2024). Another additional mitigation used by some participants was allowing students to choose their own groups, particularly when they know each other from earlier group work in the course.

There was some criticism about how the challenges and mitigations were assessed, since it was considered that some of them were very context dependent and/or had several dimensions, especially when talking about “diversity in the group”. Authors agree with this, and it was a limitation of the workshop time length, but authors hope to address this by collecting more in-depth views via the online form (link in section 5).

5 WORKSHOP OUTCOMES

- Gathered and evaluated teamwork teaching experiences and common challenges across the sector when teaching teamwork and to start identifying methods and approaches for tackling these challenges.
- The IPAC assessment methodology (Individual Peer Assessment of Contribution to group work) has been identified among workshop participants as a commonly used method of addressing/mitigating a number of issues/concerns related to the group work. Staff from all universities are

invited to try the IPAC system, that makes the running of this assessment methodology very easy - just send email to Pilar Garcia-Souto (p.garciasouto@ucl.ac.uk).
- Institutions and teaching teams should be providing staff training to better equip their academics on the running of group work. Training to students should also be expanded or formalized within the course. The actual specifics on staff and student training needed still needs to be defined.
- Authors need to collect a wider and in-depth range of experiences and views from academics. Can you tell us about your experience? Please complete the form here, still open for submissions (https://forms.office.com/e/6xzKt2GqA6) or get in touch.

6. ACKNOWLEDGMENTS

Thanks to the UCL Centre for Engineering Education for creating a culture of research on engineering education that has brought the authors together, and for their financial support to attend the SEFI conference. Big thanks to all workshop participants, your experience and comments were very valuable and insightful. Do engage with the online form to give us a more in-depth account of your experience.

denis.gillet@epfl.ch

ABSTRACT

Digital solutions play a key role for enabling blended learning in higher engineering education, where the acquisition and the appropriation of core competences and transversal skills require interactive resources offering a high-level and quasi-professional learning experience. Hence, it is essential to help educators in the process of designing and implementing value-adding resources, considering both their pedagogical and their technological dimensions. Taking into account the scarcity and the low accessibility of high-quality educational resources, it is also important to promote in academic institutions the culture of co-creating and sharing such resources, which, when openly accessible, are coined as open educational resources. In this workshop, the participants will have the opportunity to jointly discuss the nature of value-adding open educational resources, explore examples of resources with various purposes and granularity levels, and exchange on their implementation in active, collaborative, and/or inquiry learning scenarios, as well as in critical, design, systems, or computational thinking activities. The hands-on activities will be carried out using an open source and open access learning experience platform, which enables to support the full life cycle of basic or rich OERs, from their design or co-design to their sharing, through their actual implementation in the classroom and their impact assessment using learning analytics.

1 INTRODUCTION

1.1 General Framework

Digital solutions play a key role for enabling blended learning in higher engineering education, where the acquisition and the appropriation of core competences and transversal skills require interactive resources offering a high-level and quasi-professional learning experience. Hence, it is essential to help educators in the process of designing and implementing value-adding resources, considering both their pedagogical and their technological dimensions. Taking into account the scarcity and the low accessibility of high-quality educational resources, it is also important to promote in academic institutions the culture of co-creating and sharing such resources (Kimmons and Irvine, 2023), which, when openly accessible and shared with Creative Commons (CC) licenses, are coined as Open Educational Resources (OERs).

1.2 Open Educational Resources

In general, people consider as basic OERs multimedia documents, such as images, pdf version of course material, simulations like the ones found on PhET[2], slide decks, like the ones found on SlideShare[3], virtual reality animations like some found on Sketchfab[4], or video sequences, like some found on YouTube[5]. Such resources should be accessible using a single URL, reusable or modifiable freely, and shared

[2] https://phet.colorado.edu
[3] https://www.slideshare.net
[4] https://sketchfab.com
[5] https://www.youtube.com

using CC licenses[6]. More advanced resources like MOOCs[7] can also be considered as OERs because they are often freely accessible, but they cannot easily be reused or repurposed by educators due to their license schemes. When, in addition, the OERs integrate stateful interactive elements, embedded pedagogical structure, links to external services, learning analytics, as well as communication and collaboration features, they are coined by the co-authors as rich OERs. In such a case, they need to rely on open educational platforms for storing personalized settings together with interaction traces and learning outputs linked to learners.

1.3 Active Learning and x-Thinking

Digital solutions in general, and rich OERs in particular, offer a lot of opportunities to implement active learning scenarios and x-thinking activities to develop core and transversal skills. The x-thinking abbreviation is representing either critical thinking, design thinking, systems thinking, or computational thinking, which are increasingly important educational dimensions of curricula in higher engineering education. When digital solutions are integrated in traditional educational settings to provide additional learning opportunities, the corresponding pedagogical scenarios are considered as blended learning. Blended learning can combine on-campus (in-person) and/or online, synchronous and/or asynchronous, individual and/or collaborative modalities and activities using virtual and/or physical, institutional and/or personal resources (Garrison and Kanuka, 2004; Hrastinski, 2019). The overall instructional ecosystem includes cloud platforms and digital infrastructures, devices, educational content, as well as educational or professional applications.

1.4 Learning Experience Platforms

Traditional Learning Management Systems (LMSs) are focusing on management rather than learning. Learning Experience Platforms (LXPs) are supporting the actual blended learning activities and the personalization of the learning experience. Learners can easily upload content with the integration of any number of applications (Cockrill, 2021). In this workshop, a LXP[8] integrating all the necessary services for supporting the full life cycle of OERs is considered, including the authoring service for the creation or the personalization of OERs, the service for their implementation for teaching and learning, the service to share them privately or publicly, and finally the leaning analytics service providing a dashboard and aggregated data to reflect on their impact and usage.

2 WORKSHOP STRUCTURE

2.1 General Objectives

The motivation of the proposed workshop was to provide the participants with the opportunity to jointly discuss the nature of rich value-adding open educational resources, explore examples of resources with various purposes and granularity levels (Rodríguez-Triana *et al*. 2015, Gillet *et al*. 2017), and exchange on their implementation in active, collaborative, and/or inquiry learning scenarios, as well as in critical, design, systems, or computational thinking activities. The hands-on

[6] https://creativecommons.org
[7] https://www.edx.org
[8] https://graasp.org

activities have been carried out using graasp.org, an open source and open access LXP, which enables to support the full life cycle of OERs, from their design or co-design to their sharing, through their actual implementation in the classroom and their impact assessment using learning analytics (Gillet *et al*. 2022).

2.2 Program

The activities planned for the workshop were the following:

- **30 min**: General introduction, including definition and presentation of rich open educational resources with examples, as well as presentation of previous studies on the OER life cycle in the framework of inquiry learning for STEM education;
- **20 min**: Focus group scaffolded with a questionnaire, aiming at eliciting value-adding rich interactive learning resources and at sharing potential learning scenarios for an effective integration;
- **10 min**: Wrap-up and discussions regarding expectations in terms of open educational resources, support platforms, and associated practices.

2.3 Outcome

It was expected that the participants strengthen their interest and their confidence for creating or co-creating and sharing open educational resources using open learning experience platforms. The workshop organizers also hoped to learn more about the creation or co-creation practices of the participants and their expectations in terms of support features from a techno-pedagogical point of view in higher engineering education. The discussion was structured by a questionnaire on different aspects of the participants' experience and relationship with OERs (see Table 1). The answers were displayed to the participants as a ground for discussion. As only 8 participants (P1 to P8) replied to the questionnaire, the results should be considered as qualitative, but they are aligned with feedback gathered from educators in other contexts.

Table 1. Questionnaire shared with the participants

ID	Questions
Q1	What learning experiences would you offer to your students?
Q2	What type of skill do you want your students to train?
Q3	What would increase your motivation to create learning experiences?
Q4	What would be detrimental to your motivation to create learning experiences?
Q5	What are your needs related to manage your learning material?
Q6	What are your needs related to manage learning journeys in blended learning settings?
Q7	What are your wishes related to a platform managing learning experiences of your students?
Q8	What increases your motivation to share your teaching and learning materials with others?

The first part of the discussion was related to OER in general, the second part was then directed toward the relevance and use of the selected graasp.org OER platform. The discussion started with the first two questions (Q1, Q2) about the potential objectives for OERs that may be of interest for the participants. Regarding the type of learning experience, they would like to offer to their students, all participants but one described variation of active and experiential learning scenarios such as **project-based and hands-on activities** related to real-life scenarios. In relation to that, they evoked their will to support students in developing transversal or higher-order thinking skills. In particular, **critical thinking** was mentioned by several participants. The discussion moved onto the topic of creating, managing, and sharing OERs (Q3 to Q8). When discussing the motivations to create and publish such resources, many participants agreed on the needs and benefits of **collaborating between peers in the authoring** of OERs. Three participants mentioned "being part of a community" (P3) as an additional motivation. When publishing OERs, the participants evoked the need to "get something in return" (P4), such as "learning from peers" (P1), "being paid" (P2), or recognition of the material from one's institution to increase one's reputation.

The importance of the OER platform and the technologies managing the lifecycle of the OERs quickly arose as a primary concern. Specifically, the user experience was considered by the participants as essential for them to engage in the process of creating OERs. The flexibility of the platform was mentioned by several participants as a key aspect to accommodate multiple pedagogical scenarios. In this context, flexibility can be defined as the diversity of features supporting a broad typology of learning experience. For example, the possibility to store multimedia files but also the opportunity to scaffold a learning journey, the chance to add supporting elements for the learners like AI chatbots for summarizing learning contents, or creating tailored individualized formative assessment elements. At the same time, the participants expressed their fear of systems that are complex for both teachers and students, not user-friendly, and undependable. They also considered that an easy and clear mechanism for sharing resources is essential. Along those considerations, it is interesting to note a concern regarding the lack of clarity around ownership, as pointed out by one participant.

Finally, a few participants mentioned the importance of monitoring students' progress. This is motivating the need for strengthening the implementation of **Learning Analytics** in higher education, while ensuring data privacy.

2.4 Concluding remarks

Despite the fact that most of the workshop participants were core engineering faculty members, it is interesting to see that their main concerns were about improving the learning experience and developing transversal skills for students. The challenge to create, and preferably co-create and share OERs is still huge, and no real solutions are provided by academic institutions and within communities.

3 ACKNOWLEDGEMENTS

The research results and the digital solutions discussed in this workshop are supported by swissuniversities[9] (P8 digital skills program) and BeLEARN[10].

Conference Key Areas*: Engineering skills,* Building the capacity and strengthening the educational competences of engineering educators
Keywords*:* Engineering Skills, Competences, Lifelong Learning, Continuous Professional Development, career framework

ABSTRACT

Academic staff in engineering enter the university workforce with little experience in pedagogy and educational innovation as they are recruited mostly on the basis of the strength of their research track record (Taylor, 2006, Graham 2018). As educating is a core task, we should support our educators and offer options for continuous professional development, both at starting level as well as more advanced stages of their career. In this workshop, ingredients for such professional development will be collected, discussed and shared among participants. This includes both formal

[1] *Sonia M. Gómez-Puente*
s.m.gomez.puente@tue.nl

offerings and informal ways of improving educating competencies. Professional development can be connected to well-organised and scheduled offerings. However, similar developments can also be obtained if educators engage in educational innovation processes (Stevens et al, 2023). We'll harvest best practises and categorise them according to the four levels of the academic career framework (Graham, 2018).

Given the rapid development of technology and its impact on educational practice important questions arise such as how are educators in engineering programmes keeping up with the latest pedagogical developments? What support is provided for academic staff? And, how undertaking capacity building in education reports to their career progression if at all?

1 INTRODUCTION

Academic staff in engineering enter the university workforce with little experience in pedagogy and educational innovation as they are recruited mostly on the basis of the strength of their research domain and capabilities (Taylor, 2006). Although some universities, for instance in the UK and Australia, started years ago to recruit academic staff specifically for educational roles, aiming to drive educational innovation (Probert, 2013), the recruitment strategy for academics especially in universities with a strong focus on research activity is still mostly based on the individual's research performance (Bennett, et al., 2018). In most cases, academic staff develop their competences and skills as educators during their early academic career, partly through guided professional development programmes associated to tenure and partly through teaching practice. Once the minimal requirements for tenure have been met it is less clear how professional development in the education domain is carried out (van Dijk et al., 2020) and what opportunities for capacity building do academic staff have via recognised professional development (Graham, 2018; Edström et al, 2023).

Given the current challenging landscape in engineering education, the rapid development of technology and its impact on educational practice important questions arise such as how are educators in engineering programmes keeping up with the latest pedagogical developments? What support is provided for academic staff? And, how undertaking capacity building in education reports to their career progression if at all?

2 WORKSHOP STRUCTURE AND ACTIVITIES

In this workshop participants will consider the career development and professional development activities that can support career progression in their own context.

Part 1 (~25 min): The session will start with an introduction on the career framework for university teachers proposed by Graham (2018) and discussing the 4-levels of the framework in terms of spheres of impact and career paths (See Figure 1).

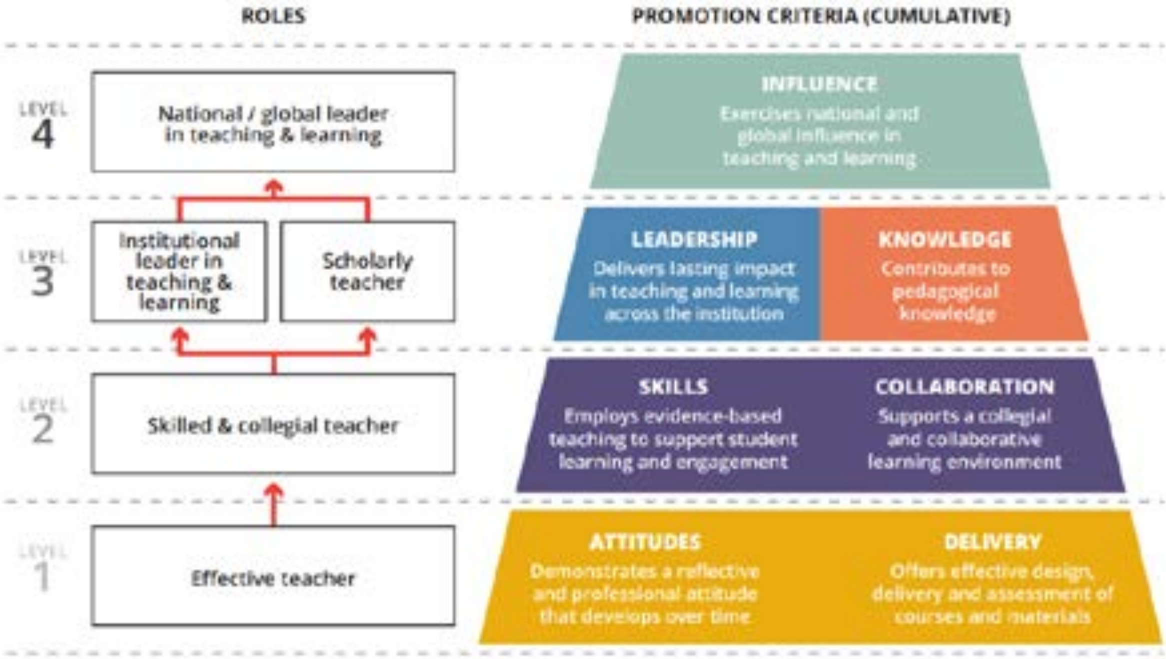

Figure 1. The Career Framework of Academic Teaching (R. Graham, 2018)

Participants will be asked to work in small groups and consider how for their own institutions each of the four levels of the framework is accompanied by continuous professional development activities.

Examples of continuous professional development activities and pathways will be presented and discussion on instances where these might or not be aligned with career progression at institutional level will be generated. Special emphasis will be made in the example of (University XXX) co-creation process to collect teachers' input through the use of Appreciative Inquiry method (Cockell, and McArthur-Blair, 2020) in dialogue sessions. The aim of the co-creation section was to develop options of pathways suitable to meet the teachers' ambitions and wishes for continuous professional development. The pathways will be shared for the purpose of inspiring other institutions and to promote sharing of experiences and learning.

Part 2 (~35 min): Participants will be asked to reflect in groups on how they balance activities related to continuous professional development and advanced teaching practice, options for scholarship of teaching and learning in which research and development are relevant and the development of educational leadership.

Finally, groups will share their examples and/or recommendations of professional development activities that support well career development and one challenge or dilemma that they see.

3 OUTCOMES AND CONCLUSIONS

Part 3: Examples and recommendations generated from the group discussions will be collected and the take-home messages from the workshop will be shared in a final flip-over to visualize the participants' input. The University XXX team will share copies of the pathways developed in order to disseminate the continuous professional development of the teachers so that this experience can serve as inspirations for other institutions.

The workshop will also provide opportunities to connect people with common interests in professional development of higher education teachers and provide a space for teachers to reflect on their own continuous professional developmental needs. Therefore, this workshop will be of interest to engineering educators and practitioners looking for professional development and networking opportunities.

Workshop outcomes

Groups were asked in relation to career professional development (CPD) and using the four-level framework (Graham, 2018) to discuss the following:

- What do you do in your university? What is in place?
- What activities would help career development?

Groups reported one at least one positive experience and one challenge they encounter in their institution. The following themes were prominent, not necessarily at all universities of particpants present at the workshop.

Positive experiences	**Challenges**
• Some professional development is in place at basic level, • A structured approach to develop Scholarly of Teaching and Learning competencies and activity, • Good and clear links of CPD to promotion, • Communities around education, • Kick-start for teaching and mentoring, • First learning opportunities for PhD's on education related topics, • Support for innovation in education, • Using teacher expertise and specialisation in teaching, • Mentoring colleagues when they enter new educational roles.	• Staff buy-in into CPD, in particular going beyond the basic level, • Bringing people together – how beyond the already engaged pioneers? • Providing alternatives for demonstrating competencies, • Having programmes that can be tailored to individual developmental needs, • Rewarding Educational activities and acknowledging them at a par with research. • Expecting individuals to be good at everything is not working good, • Adequate support for new educational roles should be organised.

Professional development options were identified per group via hand-outs showing the four levels for academic teachers (Graham, 2018). In addition to the above overview the following paragraphs summarize the collected information.

What's next

Clearly one expects that continued professional development should extend beyond the basics, acknowledging learning on the job, aiming for opportunities to network via academies for learning and teaching, teaching & learning labs, communities of learning, lunch lectures, fellowship opportunities and programs related to relevant educational topics, combining theory and practice in meaningful ways. Fellowship programs can allow some teachers to spend extra time in the scholarly teaching and learning domain, this also helps to build a community beyond the educational researchers and trainers. A challenge mentioned is how to make a good connection with the faculty level and teacher context, allowing for content specific innovation and learning on top of general didactics shared across all subjects. For those interested in educational leadership, dedicated trajectories exist in some universities, allowing academics to develop this together with other academics opting for educational leadership positions.

Continued professional development linked to HR policies.

Successful completion of the basic educational professional development requirements is often linked for tenure or promotion to a next career position. Beyond the basic level, participants agreed that education tasks and related professional development should be a substantial part of career conversations such as annual interviews. All universities, even research-intensive ones, should realize that human capacity building through excellent education is their biggest contribution to society (Crawley et al, 2020). Good teaching should be rewarded beyond teaching prizes.

Shared career frameworks help identify how universities can fill in some blanks. Also, for academics it is helpful if certain qualifications or certificates are recognized across universities and can be brought to a new job at another institute. Examples for some countries already exist in the UK, Australia, Sweden, Finland, Germany and the Netherlands were given.

Look beyond your own institute

Several participants pointed at the opportunities to also learn from what happens elsewhere. Looking at what your colleagues are doing, in your own institute or elsewhere, can inspire and accelerate educational innovations. Local networks, mentoring programs, ad hoc workshops and knowledge exchanges via European consortia or Erasmus+ were mentioned as opportunities that also support professional development. Some countries have national mentorships programs. Briefly we discussed the opportunities for SEFI to play an even larger role in this domain.

1 BACKGROUND AND MOTIVATION

The need for sustainability in engineering education is increasingly urgent as society grapples with environmental challenges like climate change, resource depletion, pollution and social inequalities. Engineers play a pivotal role in shaping the built environment and socio-technological systems that profoundly impact our planet and societies. Therefore, educating engineers with a solid foundation (e.g., knowledge and competences) in, and for sustainability is essential for creating a more resilient and ecologically sound future. Organizational and political frameworks, like UN’s Sustainable Development Goals [1] or the European Green Deal [2], can act as drivers in creating awareness and actions to integrate sustainability comprehensively and holistically in engineering education. Even though the momentum and sense urgency does exist, it might not be enough to accelerate the integration of sustainability competence into engineering education, which has been characterized as a slow process for several reasons [3][4]. For example, traditional engineering curricula focus on technical proficiency and cultural inertia within the engineering community that prioritizes conventional approaches and resists change, or accreditation standards and regulatory frameworks that traditionally emphasized technical aspects of engineering rather than sustainability criteria [5][6]. Ultimately, overcoming the inertia in engineering education requires concerted efforts from academia, industry, accreditation bodies, and policymakers to prioritize sustainability and foster a culture of innovation and adaptation within the engineering profession. European Society of Engineering Education (hereafter SEFI), through its Special Interest Group on Sustainability (hereafter SIG on Sustainability), as a professional community plays a pivotal role in creating awareness, building capacity and engage engineering educators, institutions and other stakeholders transform engineering education research and practice towards a more sustainable education. Additionally, by equipping future engineers with the knowledge, skills, and mindset to address sustainability challenges, we can ensure that engineering continues to serve society's needs while safeguarding the planet for future generations.

That said, SEFI SIG on sustainability proposes a workshop in participants discuss challenges engineering education practitioners and researchers experience in integrating sustainability education in their context and envision plans for action.

2 OBJECTIVES AND TARGET AUDIENCE

The workshop welcomes all SEFI community attending the annual conference and its members, and comprises the following objectives:

1. Share experiences on integrating sustainability education in engineering education.
2. Discuss perceived barriers in integrating sustainability education in engineering education.
3. Prioritize barriers: most relevant and least relevant to act upon.
4. Outline of suggested actions to address most relevant barriers listed.

.

3 WORKSHOP OUTLINE, SCHEDULE AND OUTCOMES

With a 1-hour duration, the workshop takes the shape of a structured brainstorming exercise and takes inspiration on techniques used on creative thinking and participatory design approaches. For example, the workshop exercises are inspired by '1-2-team' technique to foster individual brainstorming and create spaces for participation, and future workshop approach to co-create collective meaning and envision actions to address contextual barriers.

Table 1 Workshop Schedule

Time	Exercise	Expected outcomes
14.15 - 14.25	Introduction and warm-up exercise	Workshop overview. Working teams (max. 4 members).
14.25 - 14.30	Individual brainstorm on: What conflicts does sustainability bring to engineering education?	Individual experienced, or perceived barriers.
14.30 - 14. 50	Rank, sort and group to create meaning.	Barriers grouped in broad groups, or themes. Prioritize and match between working groups and barriers.
14.50 - 15.05	Non-utopian divergent discussion: What kind of actions could address the barriers the group chooses?	Collective maps/schematics with proposal actions to address chosen barriers.
15.05 - 15.15	Elevator pitch: share different maps. Follow-up through SIG action plan 2025.	Proposal to follow up with outcomes of the workshop (e.g., call for practice examples, storytelling, etc.)

4 OUTCOMES AND CONCLUSION

Overall, the workshop was successful and attracted between 40 to 50 colleagues who actively engaged in project activities. Such engagement and active participation led to a list of twelve topics that illustrated the "conflicts" sustainability brings to engineering education. The topics are listed in the box below (table 2). These twelve topics not only illustrate conflicts but also concerns, opportunities, and "musts" to better integrate and educate engineers for a sustainable future. Additionally, the topics hint at the transformative, holistic, and multistakeholder perspectives required to change towards a more sustainable education, which can be challenging for the traditional context and mindset of engineering education and practice.

Table 2. Topics outlined by participants and as result of their individual brainstorm, pair sharing and group discussions.

• Contextualization of sustainability in subject • Industrial needs for sustainability (competence) VS how industry operationalized • Affordability versus sustainability • Green solutions being promoting • Teacher agency to bring content (mindset and skills) • Frameworks and metrics: who decide and why? • Life cycle and circular economy (content) • Cultural shift and mindset • Curriculum structures/ rational and pedagogies • Complexity versus simplicity of traditional approach to problem solving • Resources (incl. human resources, time, money) for change • Capacity building

Finally, we recognize that the workshop was ambitious regarding tasks for the time given, and for this reason, the elevator pitch was not completed, and the non-topic divergent discussion was adjusted in the session.

The workshop integrates the SEFI SIG on Sustainability and therefore, its outcomes were shared and discussed as part of the SIG General Meeting, which took place during the conference on September 2, from 17.00-18.00 (CEST). The idea to "conclude" the workshop in the SIG meeting enable to participants to sort and rank feasible actions following by big group brainstorm on how they can integrate/ be disseminating through the SIG action plan for 2025. We expect this SIG workshop to create momentum for its members and strengthen their engagement as well as to raise awareness among the broad SEFI broad, allowing the SIG on Sustainability to fulfil its mission and goals.

In conclusion and considering the workshop objectives and target audience, we conclude that the workshop fulfilled them in full.

ABSTRACT

Jupyter notebooks offer multiple pedagogical scenarios for teaching computational competences in sciences and engineering courses. In this workshop, we want to help teachers design educational Jupyter notebooks so that their students go beyond “just playing” with code and a graph or animation. This workshop centers on a set of criteria, in the form of a rubric, which can be used to ensure that Jupyter notebooks are designed to effectively reach the intended students’ learning goals. Participants will work with two different educational Jupyter notebook examples to gain familiarity with pedagogical scenarios for using Jupyter notebooks, learn to identify quality criteria, evaluate instructional quality using the rubric, and propose improvements. The session will foster collaboration and reflection and enable educators to design didactically powerful instructional notebooks that teach disciplinary and computational thinking in the most efficient ways. Overall, the rubric offers a systematic approach to enhance the effectiveness of instructional Jupyter notebooks, contributing to improved teaching and learning outcomes in computational thinking skills embedded in disciplinary education.

1 INTRODUCTION

Computational Thinking (Curzon et al. 2019), i.e. data driven methods and algorithmic approaches to problem-solving that are based on principles inherent to computer science, are now at the heart of engineering and permeate all STEM disciplines. Jupyter notebooks, interactive documents that embed executable code snippets, have been shown to provide valuable features to teach computational thinking in context (Lee et al. 2024). Indeed, they provide an environment in which computational thinking and disciplinary thinking can be taught together. However, designing notebooks that are instructionally efficient is a challenge, in particular because of cognitive load issues (Robins 2022; Merrienboer, Kirschner, and Kester 2003). To ensure a positive impact of their notebooks on student learning, instructors should apply a range of instructional design principles that span from textbook design (Behnke 2021) to interactive visualization design (Mayer 2014), in addition to general principles from learning sciences such as active learning (Freeman et al. 2014) and feedback (Hattie 2009). This workshop introduces participants to a self-assessment rubric that they can use to evaluate their notebooks against such principles, including guidance and examples to improve their instructional design.

2 WHAT ARE RUBRICS?

Rubrics are a set of criteria, performance levels and descriptors linked to learning objectives. They are widely used in higher education for evaluating student performance, peer assessments, and self-evaluation (Jonsson and Svingby 2007; Reddy and Andrade 2010; Brookhart and Chen 2015). Rubrics to analyze teaching practice have also been proposed (St-Pierre, Bédard, and Lefebvre 2012). Research consistently shows positive effects on academic performance, self-regulated learning, and self-efficacy, regardless of factors like age, gender, or educational level (Panadero et al. 2023). Controlled experiments demonstrate that using rubrics leads to more accurate self-evaluation (Krebs, Rothstein, and Roelle 2022) and can enhance teachers' diagnostic skills (Smit et al. 2017). We recommend that educators incorporate rubrics during the design and revision of computational notebooks to align them effectively with intended learning goals, including improved conceptual and computational thinking.

3 THE JUPYTER NOTEBOOKS FOR TEACHING AND LEARNING RUBRIC

Our Jupyter Notebooks for Teaching and Learning (JNTL) rubric has been designed in the context of the "Jupyter Notebooks for Education" project at EPFL, Switzerland. Two of the authors have performed an extensive literature review to identify the criteria used to evaluate interactive online learning material and the components of computational thinking relevant to science and engineering practice (we provide example references below). This review has also been shaped by work performed by some of the authors on experiential learning in higher education (Tormey et al. 2021). This review led to a preliminary list of criteria that could be used to evaluate five different use cases for notebooks in education namely interactive virtual demonstrations, interactive textbooks, exercise worksheets, project and lab reports and graded assignments. After the selection of a first set of criteria, two independent raters have assessed notebooks produced in four different courses at the institution. The rubric has been further refined based on the level of interrater agreement, in particular by clarifying the criteria and adding examples. Finally, the rubric has been interactively improved through interaction with teachers in notebook development projects. This work has resulted in the publication of an online guide for designing Jupyter notebooks for education (https://go.epfl.ch/notebooks), where the rubric is publicly available under a Creative Commons Attribution license (https://go.epfl.ch/notebook-rubric).

In its current version, the JNTL rubric includes 15 criteria organized into 6 categories:

1. **Structure:** learners need clear learning goals to direct their learning (Hattie and Donoghue 2016) and an explicit segmentation with a logical progression in the notebook to navigate the material.
2. **Disciplinary thinking:** explicitly modeling disciplinary thinking and embedding learning into disciplinary-relevant content is likely to maximize transfer (Hattie and Donoghue 2016).
3. **Computational thinking:** students can only learn computational thinking if it is modeled explicitly in the notebook, which can be done through “computational narratives” (Granger and Pérez 2021), i.e. code (if adequate with respect to learning goals) associated with explanation.
4. **Supporting representations:** since notebooks support multiple types of representation, a careful choice and design of representations is necessary to avoid cognitive load issues (Ainsworth 2006).
5. **Learning activities:** notebooks should actively engage students in processing information at a deep level, by including activities with scaffolding (Quintana et al. 2004), providing feedback – to students and to teachers (Hattie and Timperley 2007) – and including reflection questions (Ryan 2013).
6. **Assessment:** to ensure the fairness and validity of graded assignments, notebooks should include a description of the assessment criteria as well as performance level indicators (Hattie and Donoghue 2016).

Not all criteria apply to all notebooks of course, but the rubric is designed to provide a complete and seamless guide to evidence-informed design of high-quality instructional notebooks for all five use cases scenarios.

The JNTL rubric is now used by pedagogical advisors at two large engineering institutions in Switzerland to provide feedback to teachers developing notebooks for education. This workshop is an opportunity to share the rubric and the associated evidence-informed best practices more widely, but also to get feedback from participants on the usability and usefulness of the rubric.

4 LEARNING GOALS

This workshop will introduce participants to Jupyter Notebooks and demonstrate five pedagogical scenarios for using notebooks in the engineering curriculum. Participants will apply the rubric to assess two example notebooks. The workshop will feature examples from our two engineering institutions.

At the end of this workshop, participants should be able to:

- Describe five pedagogical scenarios where Jupyter Notebooks provide useful features for teaching computational thinking to engineers.
- Identify and explain relevant quality criteria for Jupyter notebooks in the different pedagogical scenarios.
- Evaluate the instructional quality of Jupyter notebooks in two of the pedagogical scenarios using a rubric.
- Propose improvements to increase the instructional quality of Jupyter notebooks using information in the rubric.

5 FACILITATION PLAN

Total duration: 60 min.

Introduction (10 min.):
- Presenting five pedagogical scenarios for developing engineers' Computational Thinking with Jupyter Notebooks
- Identifying the challenge of cognitive load in notebooks
- Introducing the categories and underlying principles of the rubric

Group activities with the rubric (45 min.):
- Evaluating a demonstration notebook and coming up with suggestions on how to improve the notebook, using the following set of criteria from the rubric (15 min, groups of 2-3): Code visibility (criteria #6), Learning activities (#10), Feedback to students (#12).
- Sharing findings (5 min, plenary)
- Evaluating an interactive textbook notebook and coming up with suggestions on how to improve the notebook, using the following set of criteria from the rubric (15 min, groups of 2-3): Disciplinary embedding (#3), Expert thinking modeling about computational problem solving (#5), Learning activities (#10)
- Sharing findings (5 min, plenary)
- Reflection and feedback on using the rubric: difficulties, challenges (5 min, plenary)

Conclusion (5 min.): take home messages, filling out a feedback form.
Participants will need a laptop and Wi-Fi connection to participate in the activities.
We will provide free access to the JupyterLab platform of our institution.

6 SUMMARIZATION OF THE RESULTS

Twenty-one participants attended the workshop. While none of them considered themselves experts about Jupyter Notebooks in teaching and learning, a bit more than half of the participants reported using notebooks regularly. Around one third had seen or used a notebook only once or a few times, while the remaining participants had no prior experience with notebooks.

The demonstration notebook that participants analyzed in the first activity included a simulation of the diffusion process based on a random walk algorithm together with a set of exploratory questions. Applying the rubric, a majority of participants suggested improving the notebook by providing solutions to the questions, so that the students get feedback. We took the opportunity to discuss the various possibilities to provide feedback in Jupyter Notebooks, e.g. using interactive quiz questions.

The interactive textbook example was an introduction to Machine Learning and Data Processing for Food Sciences. The notebook included explanatory text with illustrations as well as code demonstrating the different steps for preparing data for a machine learning task. Participants reported that this example was a little more difficult to work with, as the notebook was longer and more complex. Nevertheless, the participants used the time well to work through it with a different set of criteria from the rubric. More than 70% suggested including questions with automated feedback in the notebook in order to improve student learning. We took the opportunity to discuss how to design automated tests for students to self-evaluate their code.

All the respondents to our survey (80% of the participants) found the content of the workshop interesting and felt there were adequate opportunities to ask questions. Most of the participants found valuable the experience of applying the rubric to example notebooks. The level of difficulty to apply the rubric to Jupyter Notebooks was perceived to be easy to medium. About 80% of the participants reported that they were likely to use what they learned in the workshop in their own teaching.

ABSTRACT

How to make a Code of Conduct (CoC) supportive for responsible and inclusive behavior? Historically CoC's were mostly legalistic in nature (Rezaee, Elmore, and Szendi 2001), describing a 'low road approach': naming what is NOT allowed. Today, the discourse in CoC's is more focused prescribing how we should behave, which can be described as a 'high road approach' (e.g. (Walsh et al. 2023). A CoC that is merely signed for notice, or even left forgotten in a drawer, will not make people behave differently. Its potential significance remains unreached when individuals just know about it, without understanding or engaging with it. Buff and Yonkers demonstrate that students can enhance their comprehension of CoCs

[1] *Corresponding Author*
P.E.A.Hermsen@tudelft.nl

(Code of Conduct) by actively participating in their development and implementation (Buff and Yonkers 2005).

In our university we designed a workshop that creates the conditions where the sensitive topics of a CoC and behavioral changes can be addressed. This CoC and workshop collectively become a catalyst for cultivating responsible and inclusive behavior. In short, participants first deconstruct their CoC and then collaboratively (re)create it. In this process, participants identify their own perspective on the CoC, empathise with each other's perspective and together negotiate a new or improved set of values. The emphasis is not on the iteration of the CoC, but on the exchange of perspectives and interpretations of the existing CoC. This impactful personal learning experience can be applied beyond the workshop.

The workshop is relevant for all SEFI participants.

1 INTRODUCTION

1.1 Context

In engineering education, and society at large, there's growing recognition of the need for socially safe environments and that this is shaped by how people behave towards each other. Therefore companies, and (educational) institutions refer to describing both unwanted and endorsed behavior in a Code of Conduct (CoC).

While CoCs can contribute to realising responsible and inclusive behavior, they are not a comprehensive solution by themselves. In our university we often see that CoCs remain overlooked or underutilized, residing in drawers or merely serving as legal documents for students to sign and never look back on. Hence, CoCs alone will not foster a more inclusive environment. A CoC holds little significance if individuals adhere to it without fully understanding it or engaging themselves.

1.2 Cultivating responsible and inclusive behavior by using a CoC as catalyst in a workshop.

To cultivate responsible and inclusive behavior in practice, a CoC requires endorsement of the CoC from individuals, teams, and the wider community. This does not happen automatically but requires effort. A workshop can serve as an initial catalyst for generating endorsement. Therefore, we created a workshop for students in our university, in which they identify their own perspective on a CoC, empathise with each other's perspective and together negotiate a new or improved set of values to adhere to. In our workshop participants deconstruct the CoC to understand its meaning and then improve it based on their deeper understanding of it. This workshop offers a safe space to address sensitive issues such as desirable and undesirable behavior. Anyone in the SEFI conference is welcome to join. The workshop structure is detailed below.

1.3 Relevance of this workshop

The beforementioned workshop is adapted to the audience of SEFI. The primary purpose of the workshop is to demonstrate a practical and accessible format for activating the content of a CoC and with that shaping responsible and inclusive behavior in engineering education.

1.4 Outcome / Objectives

- Participants will experience that co-creating a CoC is a valuable step in the manifestation of responsible and inclusive behavior in a community / group of peers / groups of students that the CoC is addressing.
- Participants will become aware of their individual perspective and the perspective of others on a code of conduct, and that this leads to different interpretation, explanation, and emphasis of the content of a CoC.
- Participants will become aware of the conduct that is expected at SEFI.
- Participants will feel empowered to improve a CoC and/or change the way people engage with it.
- The materials will introduce participants to the concept of using a CoC as a tool.
- We will also gather anonymized feedback on the SEFI code of conduct.

2 THEORETICAL BACKGROUND

Research from (Rezaee, Elmore, and Szendi 2001) shows that CoC’s were mostly related to conflict of interests, compliance with university's policies, tenure and promotion policies, and financial fraud and fraudulent conduct in research and scholarly activities. Most codes of conducts were legalistic in nature (2001) and described as having a 'low road' approach; describing what is NOT allowed and were not with a 'high road' approach; describing how we should behave. The discourse around CoC’s today is more about ethical behavior (e.g. (Walsh et al. 2023), diversity & inclusivity, and artificial Intelligence (Sinha et al. 2023).

Yet, even in medicine, where one might expect a fair degree of ethical professional behavior, a recent scoping review on knowledge awareness and use of professional CoC's, shows that most medical professionals found themselves unaware of the content of the CoC and did not use them regularly in practice. (Collings-Hughes, Townsend, and Williams 2022).

Already decades ago, Loeb (Loeb 1971) showed that in assuring effectiveness of a CoC, consensus of participants in the CoC is a major consideration. Buff and Yonkers showed that by involving students in developing CoC’s, they can improve their understanding of how and why codes of conduct are developed, designed, and implemented in the workplace (Buff and Yonkers 2005). Yet at our university CoC’s are often overlooked or underutilised, left forgotten in drawers or merely signed without further consideration. Research on students' reflections on professional engineering codes of conduct suggested that a scaffolded discussion, where there was a space for different voices to be heard about the code, lead to a more cohesive interaction with the code. It is suggested that if students contributed as maker-of-meaning instead of recipient of knowledge, it gave a power and agency. (Gwynne-Evans 2021)

This leave us to conclude that the conversation on the CoC is critical for a CoC to have impact. That is why we created a carefully designed workshop that involves different voices and makes individuals as makers-of-meaning and in that way incorporates their diversity in knowledge, experience, mental models, interpretations, norms, culture, and values.

3 WORKSHOP SETUP (METHOD)

3.1 Theoretical underpinning

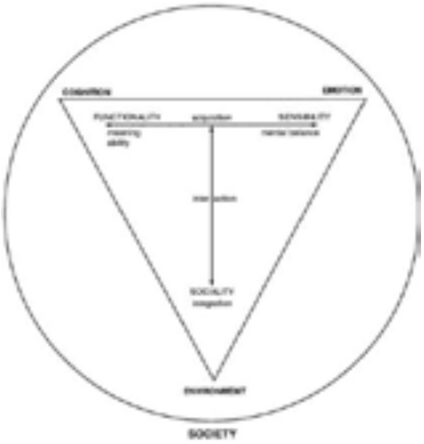

Fig 1: The processes and dimensions of learning according to Illeris

The main principle behind the setup of the workshop is the learning theory by Illeris (Illeris 2003) (depicted in Fig. 1) that describes that learning is initiated by external impulses and always takes place with the integration of two processes (1&2) and three dimensions (A-C):

1. An **external interaction process** between learner and their social, cultural, or material environment (vertical line).
2. An **internal psychological process** that is an interplay between cognition and the emotional function of an individual (horizontal line).

A. The **Cognitive learning dimension** covers for example learning content, existing knowledge, and skills and where the learner builds up their understanding and ability.
B. The **Emotional dimension** entails mental energy, feelings, and motivation.
C. The S**ocial dimension** is the dimension of external interaction such as collaboration and co-operation.

Our workshop is a context specifically designed reflective impulse (Hermsen et al. 2023; Illeris 2003) that triggers both processes and addresses all three dimensions. In short, the setup is as follows:

First, participants deconstruct the SEFI CoC in segments, next they respond from their personal perspective and experience to these segments in relative anonymity. Afterwards they discuss the similarities and differences in these responses, and finally they collaboratively iterate on the CoC. In this way both the **external interaction process** and the i**nternal psychological process** are activated.

To support the **cognitive dimension**, we provide clear instructions and worksheets, that scaffold and guide participants to explore their personal beliefs, opinions, and gaps in understanding regarding the CoC. In the **emotional dimension** we design visually appealing material and scaffold workshops steps to support participants' learning. We create an environment where knowledge gaps can be anonymously shared, encouraging honesty and genuine responses. On the **social dimension** we create a collaboration spirit by taking the time to connect and we deliberately create space for all voices and facilitate collaborative creation of meaning.

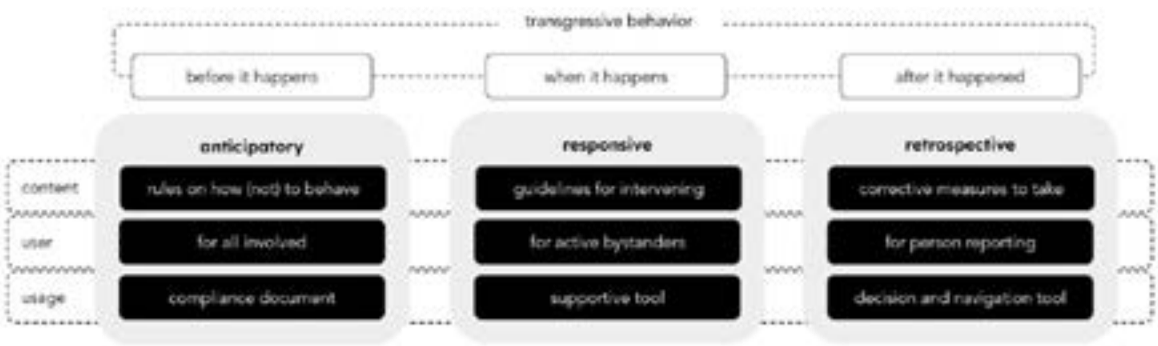
3.2 Detailed setup of workshop

Introduction to (and familiarity with) SEFI 2024 Code of Conduct (5 min)

We will introduce the general context of Codes of Conduct in engineering and education, along with the SEFI 2024 CoC. Through a brief plenary inventory, we will question participants' awareness and opinions on the SEFI 2024 CoC, aiming to highlight the diversity of perspectives.

Framing the CoC as a tool (10 min)

We will introduce that in the workshop participants will experience that a CoC can (only) be a vessel for responsible collaboration, if it is used to discuss human interaction. By using our framework on anticipatory, responsive, and retrospective use of a CoC, we contextualize the SEFI CoC and offer a (systematic) user perspective on CoC's in general.



Activating Rules for Engagement (30 min)

Our workshop setup initially assumed that understanding the SEFI Code of Conduct (CoC) would require effort, and that we would need to take time for that, before we could go into activating its content and fostering ownership. However, the 2024 SEFI CoC proved to be straightforward. Despite this, aligning actual behavior with the CoC still relies on activating and applying its principles in real-life contexts. Consequently, at the conference we dedicated more time to experiencing building consensus around rules for engagement in small groups.

First, we presented participants a realistic and ambiguous situation, where creating consensus on rules for engagement is important to understand how to move forward. We only imply a supportive use of the SEFI CoC, by having it available at the table.

Next, the participants form groups of 3 to 4 and are provided with templates and instructions, that boil down to this:

1. Individually, participants note down their observations / thoughts / feelings on this situation.
2. Individually, participants imagine themselves as a participant in this situation and answer the question: what would you do?
3. As a group, they compare and discuss perspectives on the situation and what each of them would do. We provide them with prompts to stimulate including

thinking about overrepresented / underrepresented people / power balance / distribution of privilege etc.

4. As a group, they agree on how they would deal with the situation, both from the responsive perspective as well as the retrospective perspective (see framework).
5. As a group, they take on the anticipatory perspective, by extrapolating what behavioural guidelines they would agree on if they were doing a project together. In this way, the exercise closes with the creation of a mini CoC that is actionable and suitable for responsive use in this small project group.

Conclusion: (10 min)

First, we will get a sample of the experience and insights of participants, with particular interest in:

- If and how this CoC workshop created a shared understanding of responsible and inclusive behavior.
- If and how the conversation on the CoC helps to embody responsible and inclusive behavior.
- The SEFI CoC is a comprehensible CoC that only needs a conversation on how to make it actionable.
- Frequently, students experience a comprehension gap, where they do not fully understand the CoC. In that case, deconstructing and iterating on the CoC is useful to gain shared understanding of responsible and inclusive behavior.

Furthermore, we share our take home messages:

  - Personal values and knowledge and perspective affect how you engage with a CoC and each other.
  - The conversation on the responsive level of a CoC help students to be more responsible and inclusive (for example in collaboration).
  - A CoC is not a comprehensive solution. It is a tool that needs additional work.

Closure

We invite the participants to leave constructive feedback on a plot of the SEFI's CoC.

4 RESULTS

Participants experienced that merely having a code of conduct is not enough to help students behave inclusively.

Several participants noted that the conversation in this workshop provided them with a much clearer understanding of how to interact with each other than they would have gained from merely reading a Code of Conduct.

Innovative ideas on how to shape that interaction were shared, as for example the use of "different hats" in discussion or providing props with which people can share their feelings and reactions non verbally.

Participants appreciated our approach of guiding the conversation through structured exercises and the use of a worksheet.

5 DISCUSSION AND IMPLICATIONS

Worth noting is that a group pointed out that our example situation presented a stereotype and they felt nudged into a certain train of thoughts. In hindsight this situation was more neutral than they experienced it. This illustrates that in case of dealing with situations of transgressive behavior, everyone is influenced by a biased perspective, and it is in conversation where we can bridge theses biases and perspectives.

As Donna Riley emphasized in her keynote on day 4: we need to keep the consensus moving. It is now up to the SEFI community to engage in continuous conversation about the meaning and implications of the SEFI CoC, and how it can be applied in practice, both in and beyond the conference setting.

Educators interested in the CoC workshop design for students or this SEFI workshop are encouraged to contact us.

6 ACKNOWLEDGEMENTS

We would like to thank SEFI group that developed the CoC for excellent work, and in particular Iñes Direito for providing us with the draft version of the CoC which enabled us to prepare.

1 INTRODUCTION

Current global challenges are putting pressure on educational systems. Issues such as climate change, global health issues, social injustice, and rapid AI developments are reshaping the landscape of engineering education. Universities are challenged to think afresh about how they can participate in the project of rethinking the responsiveness and relevance of their curriculum and mode of pedagogy regarding those environmental, social, and political realities (Mostafavi 2020).

The central question within this challenge for universities revolves around preparing students with future-proof competencies to take agency and responsibility, that transcend traditional boundaries and equip them for the future (learning for life). What implications does this hold for engineering education, students, and the learning environment they inhabit? Are the university teachers skilled and equipped at guiding students in this direction? Do these learning environments have the flexibility and agility to foster students' autonomy?

[1] S.C.Mooij
s.c.mooij@tudelft.nl

Educational theories have evolved, emphasizing interactive, collaborative, and transformative learning experiences, where learners actively engage in knowledge construction. VUCA (Volatile, Uncertain, Complex, Ambiguous; Kamp 2016) and BANI (Brittle, Anxious, Non-Linear, Incomprehensible; Cascio 2020) worldviews and pedagogical frameworks such as the CDIO standards (http://cdio.org) and the Engineering for One Planet framework (https://engineeringforoneplanet.org/) highlight the need for skills beyond the technical domain, stressing resilience, flexibility, and intra- and interpersonal competencies. Engineering education often involves complex concepts and problem-solving skills, and when students are actively engaged in their learning process, they are more likely to understand and retain information effectively (Biwer et al. 2020). However, many of the engineering degree programs still lack the flexibility to facilitate student agency, focusing on specific learning objectives that relate mostly to technical skills or competencies, while neglecting the development of personal and interpersonal skills. In addition, failure as an opportunity to learn is often not acknowledged and the pressure of the assessment system often inhibits students' willingness to take responsibility for their learning.

From a students' perspective, not all students are prepared to take on such responsibility and some may have different expectations from the curriculum. Additionally, the freedom to make choices in learning can lead to moral dilemmas when conflicting obligations arise (Van den Hoven et al. 2012). From the teachers' perspective, many teachers struggle to relinquish control, steer too much and by that hinder student autonomy. Lastly, it remains largely unclear what kind of pedagogical approaches and interventions really 'work' and how they can be adapted to diverse educational contexts.

Addressing these challenges and reconceptualize curricula to foster responsibility is crucial. As part of the broader research programme to which this workshop contributes, we aim to improve our understanding of the theme at hand, and develop evidence-supported strategies, interventions and concrete tools for students, teachers, and the educational organization. The ultimate goal is to empower engineering students to take control of their learning trajectory and professional development within a supportive learning environment that values personal and interpersonal growth.

2 LEARNING OBJECTIVES

The workshop aims to familiarize participants – using input from the workshop organizers as well as from each other – with concrete ideas on how to further enhance their current approaches in engineering education and to stimulate students to take responsibility for their own learning process. For this, we will make use of an action plan template. The template untangles both the pedagogical principles of their current teaching practices at course design level or lesson delivery level or the programme and organizational principles they abide by and the intended interventions for improvement. Second, participants will learn to position those practices and ideas for intervention. This exercise is based on our framework that structures pedagogies and will improve their understanding of the broadness and complexity of the students-taking-responsibility (STR) theme. Third, this workshop introduces them to a network of people interested in the responsibility theme.

As workshop organizers, we aim to learn ourselves as well. We will learn how the participants are currently tackling the responsibility theme, how open they are to making changes in their teaching practices, and how they perceive the challenges in achieving this goal. Additionally, we aim to build an international network around this theme, as a sounding board for the TU Delft Innovation in Delft Engineering Education (IDEE) research and innovation program.

3 WORKSHOP STRUCTURE

The workshop will be structured across 3 stages (Figure 1): an introductory stage (Steps 1), an analysis stage (Steps 2-5), and a reflective stage (step 6). Involvement across the three stages varies from individual (stage A), to working group (stage B), to the entire group (stage C). One template will be shared with each participant at the beginning of the workshop to collect their personal information. Another template will then be distributed amongst the groups to guide the workshop process by [a] supporting participants to make explicit and document their thinking, and [b] capturing the information exchanged during the workshop so that organizers can further elaborate and reflect on the input received by the participants. The individual and group templates will be collected upon the workshop's completion. Participants who wish to receive more information about the workshop findings will be given the opportunity to fill in their email address in which case a summary of the workshop findings can be sent to them later.

Fig. 1. Workshop structure across stages and steps

STAGE A – SETTING THE STAGE (5’)

Step 1 | Participants will be asked to introduce themselves on the **first (individual) template** using one to three keywords. They will also be asked to specify their professional capacity in the institution they represent e.g. learning developers, educators, researchers, program coordinators, etc., and asked for their consent. In addition, they will be asked to provide us with a tentative definition of what the theme ‘Students Taking Responsibility for their Learning’ stands for and to also identify how relevant it is for them (on a scale from 0-10).

Afterwards, participants will be split into groups of 4 individuals and be given the second (group) template.

STAGE B – REPORTING FROM EXPERIENCE (OR *IMAGINING*) (40')

Step 2 | Participants have a short round of introduction within their group. They are asked to come up with a **case from their personal experiences** where they were challenged to assign students with more responsibility for their learning and pitch it to their group. If there is no real example they can refer to, participants will be invited to sketch a potential case/idea. They can focus on STR on any of the following levels: [a] **organization/program** level; e.g., customizing study program per student, [b] **course** level, e.g., developing multiple online and on campus learning environments, and/or [c] **lesson** level, e.g., experimenting with diverse modes of feedback [12', max 3' each]

Step 3 | For this step, participants will pick one of the examples presented within their group and describe this case in more depth on the **second template** collectively [3'].

Step 4 | They will then be asked to dissect their idea across several points related to planning and implementation as presented on the second template [10']:

- What was/is your motivation in increasing students' responsibility over their learning process? What inspired you to try this idea? (a book, an article, a policy?)
- How were the students' roles changed? (or *how would you like them to be changed?*)
- Were there any additional measures taken by you or your institution to support the changes? (or *would there have to be additional measures taken by you or your institution to support the changes?)*
- Can you identify any (potential) challenges?

Step 5 | After completing the intervention of step 4, participants will collectively reflect on the (projected) results of their chosen example [15'].

- Was their intervention successful? (or alternatively, *what would make the intervention successful?*)
- What did/didn't work? (or *what could hinder implementation?*)
- Was there a way to measure before/after? If yes, how? If not, why and what could it be?
- How did the students react to said changes? (this applies only to real case examples) or *how can student satisfaction from applying STR approaches be measured?*

STAGE C – PLENARY SESSION: WEAVING THE LESSONS LEARNED (15')

Step 6 | During this last stage of the workshop, one person per group will share one main finding of the group (2'-3'' per group, for a maximum of 3 groups, max. 10' in total) with the others. Then, workshop organizers will wrap up (5') the workshop and share information about the IDEE program so that participants who are interested in this project can reach out in the future.

4 EXPECTED RESULTS – COMMUNICATION OF RESULTS

Workshop organizers will collect the templates from the participants and synthesize their input. Based on the workshop structure and the information on the template, several outputs can be harvested:

- Output 1: tentative definitions of STR by participants (stage A, step 1)
- Output 2: an approximation of how relevant this theme is to the workshop participants (Likert scale from 1-7) (stage A, step 1)
- Output 3: examples of different approaches to STR across different levels (stage B)
- Output 4: challenges to implementing STR in education across levels (stage B)
- Output 5: examples of additional measures/features that can support STR practices (stage B)
- Output 6: recommendations to implementing STR (stages B and C)

This workshop will be mostly based on participants' real case experiences or their imaginaries for STR so, it is expected that nuanced interpretations of what STR means to participants can be harvested and further elaborated on the day of the workshop but also during the assessment of the workshop results. The workshop output can be a first step to build a Pedagogical Pattern Language (PPL): a structured framework for capturing, organizing, and sharing effective teaching and learning practices in Engineering Education. The real time cases that will be discussed during the workshop can further be used to populate IDEE's own PPL across all three levels respectively (organization-course-lesson).

5 RESULTS OF WORKSHOP

Seventeen conference attendees participated in the workshop. To define STR, participants distinguished 4 aspects of STR: students [1] willing to search, explore and experiment with learning; [2] taking ownership for their learning; [3] being able to identify their needs, strengths, weaknesses and [4] taking action (e.g. setting goals; seeking help; suggesting learning activities). Organizations and teachers can help them by creating opportunities and provide students with sufficient confidence, skills and means to find a learning path that suits them best.

All participants endorsed the importance of STR (7.6 out of 10); lecturers and course developers (8.1) more than participants that indicated themselves as researchers (5.6).

Most participants are interested in STR on different levels (lesson, course, program, and organization). Nonetheless, they described STR experiences mainly at lesson or course level. These included their experiences of [a] peer-learning, [b] critical reading and reflection as part of their lessons, [c] to implement self-guided parts in their courses, and [d] to add reflection meetings as part of the course. Only one of the praticipants described an example of STR on curriculum level and related STR as a direct effect of a curriculum that is open in content and flexible in its time limitations. Participants also raised interesting questions like: to what extent is it the students' responsibility to fight for more autonomy and self-regulated learning? And: under what conditions can students take responsibility?

In the second stage of the workshop, as an example, one of the smaller groups advocated for the increase of STR interventions through (a) making lectures more lively, (b) letting students pick their own case and do framing themselves, (c) letting students pick their own team to work with and (d) allowing for a more question-based or consultation-base teching approach. They also stressed the importance of monitoring the success of these interventions through constant feedback, the assessment of the quality of the projects, and students' reflections on the matter. They also acknowledge that teachers might react that it is more work than traditional education and that students already have a lot on their plate.

6 REFLECTION

The workshop results confirm that no one widely accepted definition of STR exists and that educators assign different attributes to STR. Nonetheless, they are intrigued by the concept and most have already experimented with it using various pedagogical approaches. On the downside, they are challenged by the level of uncertainty as to whether STR approaches are effective or not with some of the participants raising concerns on whether students are well equipped for taking responsibility. Reception of the STR project during the workshops, and the heated discussions reinforce our belief that a Pedagogical Pattern Language (PPL) is a timely and relevant endeavour.

7 ACKNOWLEDGEMENTS

We like to thank Remon Rooij and Silje Dehli, both from the Delft University of Technology, for helping us in writing this proposal and working out the templates.

Keywords: *Transversal skills, experiential learning, teaching development*

ABSTRACT

Providing authentic experiential learning activities is an important part of educating responsible engineers. In addition to disciplinary knowledge and skills, it is important that our graduating engineers achieve fluency in transversal skills. The trident framework developed by 3T PLAY helps educators ensure that they are maximising students' transversal skill development (https://doi.org/10.5281/zenodo.13328581). The framework targets three distinct but interrelated evidence-informed pedagogical

[1] *S. Isaac*
siara.isaac@epfl.ch

aspects of skill development: knowing (strategies and models to implement the skill), experiencing (opportunities to apply the skills and encounter relevant difficulties) and learning by experience (meta-cognitive/emotional reflection to promote transfer). In this workshop, participants will experience an activity developed using the trident framework and analyse it to identify the operationalisation of these three aspects. Following this orientation, participants will then work in small groups to develop activities that target transversal skills that are relevant in their own contexts. The facilitation team will provide scaffolded guidance and materials to help in developing these prototype activities (https://doi.org/10.5281/zenodo.10992806). Finally, participants will be provided with additional resources to further support their efforts and invited to participate in an online platform for sharing activities that teach transversal skills.

1 BACKGROUND AND RATIONALE

An important consideration of educating responsible engineers is providing them with authentic disciplinary experiential learning activities. In response to calls to integrate more of these practices in the curriculum, the number of project and challenge-based courses offered in engineering have increased. Rooted in disciplinary contexts, these types of activities provide an excellent opportunity to facilitate development of transversal skills (Gallagher and Savage 2023).

A limitation to the effectiveness of these contexts is that students may not identify that, in addition to the explicit objective of completing their project, there is often a more implicit goal of transversal skill development (Tormey and Isaac 2022). The result is that students fail to perceive the various pedagogical aspects relevant to transversal skill development (instruction, feedback, assessment) of their courses (Isaac, de Lima, Jalali, Rossi, Tormey, et al. 2024; de Lima, Isaac, and Dehler Zufferey 2024b; 2024a). The need to explicitly support transversal skills is further supported by studies showing that students do not develop these skills by simply engaging in activities where they practise these skills, but rather they need clear and direct instruction (Lehmann et al. 2008; Picard et al. 2022). An additional obstacle is that, when thinking about the learning affordances of experiential activities, teachers often focus on the disciplinary knowledge and overlook transversal skill development (Isaac et al. 2023).

In experiential learning, the focus is on students constructing their own knowledge (Christie and de Graaff 2017) and therefore it is essential that they have opportunities to learn from their experiences by engaging in meta-cognitive and meta-emotional reflection (Steele 2018; Turns et al. 2014; Veine et al. 2020). Recognising the value of reflection in enhancing learning gains (including that of transversal skills) several engineering educators include reflections as one of the mandatory learning activities for in their courses (Hirsch and McKenna 2008; Shekar 2007). Such meta-thinking activities help students to construct meaning from their experiences and facilitate transfer of learning to new contexts (Leberman and Martin 2004).

Our trident framework is designed to assist educators ensure that they are maximising students' learning potential by explicitly addressing the above-mentioned issues (Isaac, de Lima, Jalali, Rossi, Schmid, et al. 2024). This is done by consciously integrating three important pedagogical aspects when designing activities:

- Knowing - including information about the skill, its relevance, and associated strategies
- Experiencing - implementing the skill
- Learning from experience - meta-cognitive and meta-emotional reflections

Educating responsible engineering students involves supporting their development for a broad set of transversal skills applicable in a wide range of contexts. In practice, this means engineering educators must identify specific skills relevant for their students and integrate effective learning experiences. This workshop provided a structured approach, based on the trident framework, for instructors to improve their teaching of transversal skills. Building from example activities that address transversal skills such as collaboration (de Lima and Isaac 2024a), emotional self-regulation (Isaac and de Lima 2024a), skills that promote sustainability (Isaac and de Lima 2024b), and coaching and peer teaching skills (de Lima and Isaac 2024b), participants were introduced the trident framework (Isaac, de Lima, Jalali, Rossi, Schmid, et al. 2024) and engaged in collaborative, scaffolded activities (Isaac and de Lima 2024c) to develop their own teaching activity focusing on a transversal skill relevant to them.

2 LEARNING OBJECTIVES

This workshop was designed for engineering educators and pedagogical advisors interested in creating or refining activities to teach transversal skills. Prior knowledge of transversal skills, or experience in teaching transversal skills was not required.

By the end of the hour participants had:

- Analysed an existing activity. to identify operationalisation of key pedagogical aspects of the trident framework.
- Selected relevant transversal skills for students in a specific context (i.e., their own course).
- Designed or co-designed a first prototype of an activity based on the trident framework.
- Established collaborations with other educators.

3 WORKSHOP DESIGN

Integrating principles of constructive alignment (Biggs 1996) and backward design (Wiggins and McTighe 2005), educators designed a prototype of an experiential learning activity that targeted students’ transversal skill development.

The facilitation team had four members and therefore was able to provide personalised attention and scaffolding to the participants.

Time	Activity	Description

15’	Welcome, Introduction, Experience of activity	<u>Plenum:</u> • Welcome the participants. • Explain the aims and functioning of the workshop. • Introduce the 3T PLAY Trident and its theoretical foundations. • Accelerated experience of an activity developed using the framework
10’	Analysing the activity	<u>Small groups (max 3 per group):</u> Participants will use the trident framework to analyse the activity with a specific focus on identifying where, when, and how the three aspects of the framework were operationalised.
5’	Which skills are most relevant for me?	<u>Individual activity:</u> • Work through a checklist with a to identify individual skills (as opposed to personality characteristics or groups of skills) • Select two skills from the list that are most relevant to each participant's individual context (considering the needs of their students, institutional context, etc.) • Respond to a reflective worksheet to identify opportunities for students to implement these skills and potential obstacles.
15’	Learning from Experience	<u>Small groups (max 3 per group):</u> Participants will form small groups based on the skills they are interested in targeting, so that each group is focusing on one common skill of interest to all the members. Using principles of backward design, this phase focuses on making the learning outcomes of the prototype activity explicit. During this step participants will be guided through a scaffolded approach to clarify: • What do they want the students to walk away with? • How can they facilitate students’ transfer of the skill to a different context?
10’	Learning experiences	<u>Small groups (max 3 per group):</u> This step is about creating an experiential activity to allow students to implement the transversal skill in a low-stakes environment.

		Continuing with the scaffolded guiding, participants will design a short activity (or repurpose a prior activity) that allows students the opportunity to practise the target skill. Examples of activities will be provided.
5’	Planning continued collaboration	Plenum: Participants will be encouraged to continue developing or co-developing these activities after the conference. They will be provided with additional resources and worksheets to facilitate further development and prototyping of the activity.

4 OUTCOMES OF THE WORKSHOP

At the end of the workshop, the participants had designed a prototype of an activity. Additionally, because they were encouraged to work collaboratively in small groups formed by shared interest in a specific transversal skill, we expect that these collaborations will continue beyond the conference contributing to development of professional practitioner networks. As mentioned before, participants were provided with additional resources and worksheets to facilitate further development and prototyping of their activities.

The online open-source repository of activity guides for teaching transversal skills is both publicly available and open to additional contributions. Workshop participants were encouraged to share their activities with the engineering education community via this repository.

This workshop was based on 3T PLAY trident framework that explicitly incorporates *Knowing*, *Experiencing* and *Learning from experience* during activity design (Isaac, de Lima, Jalali, Rossi, Schmid, et al. 2024). The 3T PLAY team have used this framework to develop several activities targeting specific transversal skills (3T PLAY 2024). Additionally, we have also developed an open access self-guided self-paced activity to help educators use the trident framework and develop activities that target transversal skills that are relevant in their contexts (Isaac and de Lima 2024c). All these open-access resources are available online: https://zenodo.org/communities/3tplay/records

Keywords: *Engineering Non-technical skills, Behavioral Marking Systems*

ABSTRACT

Non-technical skills (NTS) such as teamwork, communication, and leadership are increasingly vital in engineering. As part of a phd project, we are developing the General Engineering Non-Technical Skills Taxonomy (GENTS) to systematically assess and train these skills in engineering graduates. Derived from an extensive literature review that compiles over 400 expected skills from engineers, GENTS aims to outline high-performing engineers' non-technical skills and behavioural markers.

This workshop elicits experts' knowledge in teaching, hiring, or managing engineers to refine and enhance the GENTS taxonomy. Participants will undertake tasks including sorting and categorising skill statements, providing feedback on the proposed taxonomy, and commenting on behavioural markers from interviews with industry experts. A round-table discussion will facilitate reflection on the taxonomy's comprehensiveness, clarity, and applicability, including considerations of future-

[1] ***C. Lucas***
Claire.1.lucas@kcl.ac.uk

proofing and cultural differences. This knowledge elicitation workshop aims to align engineering education with the profession's evolving demands by providing a systematic tool for assessing and training NTS.

1 INTRODUCTION

Behavioural marking systems (BMS) are used in different disciplines and industries, such as aviation and surgery. They consist of critical non-technical skills associated with observable and identifiable behaviours (Naweed and Murphy 2022). These systems often have a hierarchical structure, including skill categories, sub-categories (elements), and behavioural examples associated with each taxonomy element (Hamlet et al. 2023). Research has shown that Non-Technical Skills (NTS) interventions and feedback can have a positive impact on team performance (Moll-Khosrawi et al. 2019), and Behavioral marking systems are reliable tools that can assess and facilitate training for NTS in a repeatable way (Ravindran et al. 2021).

At King's College London's engineering department, we are developing a behavioural taxonomy to outline how an ideal engineer behaves and what markers of excellent or poor performance are for engineers. Based upon this all-encompassing behavioural taxonomy, we are creating a behavioural marking system to assess non-technical skills in engineering graduates. The first step in developing a BMS is determining the skills and competencies expected from engineers. As part of a PhD project, we have reviewed academic papers between 2018 and 2022, reports from the Royal Academy and UK Engineering Council, and surveys from the Institution of Engineering and Technology (IET). From this literature review, we have compiled a list of over 400 expectations from engineers in the form of statements or phrases. We seek participant's knowledge and expertise to help us sort these statements into relevant groups of skills and sub-skills.

1.1 Motivation & Learning Outcomes

Experts in teaching, hiring, or managing engineers in this knowledge elicitation workshop will collaborate to refine and enhance the 400 skills presented as a General Engineering Non-Technical Skills Taxonomy (GENTS). We aim to communicate foundational concepts of behavioural marking systems and their importance in assessing engineering non-technical skills. Expert participants will also critically analyse and categorise over 400 engineers' expectations into coherent groups of skills and sub-skills, leveraging their knowledge regarding expected engineering non-technical skills. Exposure to various non-technical skills also facilitates discussing, training, and developing pedagogical interventions for engineering non-technical skills. Engineering educators can also conceptualise and think about implementing non-technical expectations in their teaching.

1.2 Background and Rationale of the Session

The engineering profession increasingly recognises the importance of non-technical skills, such as teamwork, communication, and problem-solving, alongside technical expertise from different points of view. From an employability perspective, soft skills are crucial for engineering students, with non-technical skills prioritised by some employers over academic credentials (Noordin & Nordin, 2018; Pang et al., 2019; Tadjer et al., 2020). Given the rapid evolution of technology, these skills remain relevant across various contexts, while specific hard skills may quickly become outdated (Martins et al. 2021). Another important aspect of soft skills in engineering can be seen through the lens of safety and reducing the impact of human errors. According to (Nadeem and Biglari-Abhari 2020), lack of appropriate communication has been one of the major causes of significant engineering failures in projects such as the Space Shuttle Challenger disaster and the NASA Mars Climate Orbiter loss. Trends towards a competency-based model of engineering education also emphasise the importance of soft skills (Caggiano et al. 2020).

2 FORMAT OF THE WORKSHOP AND ENGAGEMENT OF PARTICIPANTS

During the 60-minute ethically approved workshop, experts will complete two tasks in part one and participate in a discussion group in part two. The tasks in the first part of the workshop are as follows:

TASK 1 Sort and name from scratch: Participants will put 40 sample skills extracted from the literature review into small and medium parcels as replicators of their suggested categories and taxonomy elements and name them accordingly.

TASK 2 Comment on a suggested taxonomy of non-technical skills for engineers: Participants will be presented with a proposed framework where all 400 statements have been sorted into 15 categories and around 100 elements. They will provide feedback on the sorting and names to refine and improve the framework, considering the following design criteria: a. Categories and elements should have maximum mutual exclusivity with minimal overlap. b. The terminology used should be recognisable to engineers (Butler et al., 2020).

TASK 3 Comments on a sample of poor and good performance behaviours linked to the taxonomy: We have interviewed twelve senior managers from world-leading engineering companies (so far), including AWE, ARM, Jaguar Land Rover, BAE Systems, IQE, Dyson, and Mott MacDonald. This diverse industry input and valuable insights from engineering lecturers at the University of Edinburgh, Aston University, and professors of practice at the Royal Academy of Engineering have focused on eliciting knowledge from expert engineers. The aim is to identify good or poor performance behaviours for each taxonomy category. Participants will comment on the behaviours extracted from an abductive thematic analysis of the interviews for one of the taxonomy categories.

The remainder of the workshop will be a round table discussion using the Delphi Method. This discussion will allow expert participants to reflect on the content of the taxonomy and voice any concerns about inconsistencies or comprehensiveness in the framework. We are interested in hearing participants' thoughts on questions such as:

- Do you think the framework is comprehensive and reflects the skills engineers need?
- Is there any required further refinement to categorise skills more understandably?
- How do you think we can future-proof the framework?
- To what extent cultural differences might affect the framework?

The workshop will follow a timeline of activities as follows:

Table 1. Workshop Timeline: Key Activities and Milestones

Activity	Time	Cumulative Time	Presenter
Intro and Principles of BMS Categories	10	10	Claire
Task 1: Sorting from scratch	10	20	All
Task 2: Individual Framework Sorting	10	30	All
Task 3: Comments on Behavioural Markers of "Contextual Awareness" Category	10	40	All
Round table	20	60	Claire & Francesco

2.1 Significance for Engineering Education

We hope this workshop represents a pivotal step in aligning engineering education with the evolving demands of the engineering profession. Providing an assessment tool for engineering non-technical skills prepares engineering graduates to excel technically and thrive in collaborative, multidisciplinary, and globally diverse work environments. The development and refinement of non-technical engineering skills taxonomy can also serve as a critical tool for curriculum development and professional development for academia and industry, ensuring that engineering education remains relevant, comprehensive, and forward-looking.

3 RESULTS

The expert participant comments on three tasks yielded valuable insights into developing and refining the General Engineering Non-Technical Skills (GENTS) Taxonomy. In Task 1, participants demonstrated a consensus on the main categories of non-technical skills for engineers. The most frequently identified categories included personal development, interpersonal skills, professional responsibilities, and project management. This alignment with the existing framework reinforces the relevance and importance of these skill areas in the engineering profession.

In Task 2, Participants emphasised the need for clarity, suggesting that the role and identity of future engineers ("problem owner"," tech expert", coordinator", etc,.) and the intended use of the taxonomy should be more explicitly defined. Additionally, participants recommended consolidating some categories to reduce overlap and improve overall coherence. This suggestion aligns well with the design criteria of mutual exclusivity and recognisable terminology for behavioural marking systems (Butler et al., 2020). The feedback also highlighted the importance of inclusivity within the taxonomy. Specifically, participants suggested explicitly including attitudes and skills relevant to gender (or tackling gender biases) in the Equity, Diversity, and Inclusion (EDI) category. Furthermore, participants proposed a practical taxonomy application by mapping it against learning outcomes in engineering programs. This approach would identify potential gaps in current curricula and provide opportunities for integrating non-technical skills more effectively into engineering education.

Task 3 focused on the behavioural markers extracted from interviews with industry experts. A key theme that emerged was the importance of emphasising observable actions rather than abstract concepts. Participants stressed the need to focus on concrete actions or verbal questions instead of less tangible attributes like "awareness" or "understanding". To enhance the practical application of the taxonomy, experts suggested incorporating established frameworks such as stakeholder analysis and PEST analysis to observe and assess behaviours. This recommendation provides a foundation for developing relevant assessment scenarios that can be integrated into existing engineering practices and education programs. Moreover, participants questioned the inclusion of poor performance behaviours in the framework, suggesting a focus on positive, observable actions instead. This perspective aligns with a strengths-based approach to skill development and assessment, potentially leading to more constructive and motivating feedback for engineering students and professionals. However, some undesired behaviours in categories such as risk and security might be easier to observe as negative statements.

3.1 Summery and Next Steps

The expert participants' feedback on developing a behavioural marking system and taxonomy for training and assessing non-technical skills reinforced the importance of non-technical skills in engineering while providing constructive suggestions for improvement. Key outcomes include greater clarity in defining the taxonomy's purpose and intended use, the importance of focusing on observable behaviours, and the potential for integrating established frameworks to enhance assessment practices. The workshop also highlighted the significance of inclusivity, particularly in addressing gender-bias-related attitudes and behaviours within the EDI category. Based on the expert feedback and workshop outcomes, we will take the following key steps to refine and implement the GENTS Taxonomy:

1. Refine the GENTS Taxonomy: We will revise the framework to improve clarity, reduce overlap between categories, and ensure comprehensive coverage of essential non-technical skills for engineers.

2. Enhance EDI Integration: In our next round of expert consultation, we will try to explicitly incorporate poor and good performance behaviours relevant to gender equality and address gender biases within the Equity, Diversity, and Inclusion (EDI) category.

3. Develop Assessment Scenarios: We will create practical assessment scenarios incorporating established frameworks like stakeholder and PEST analysis to observe and evaluate behaviours effectively.

4. Focus on Observable Actions: We will revise behavioural markers to emphasise concrete, observable actions rather than abstract concepts, improving the assessment tool's objectivity and applicability.

5. Pilot Implementation: We will conduct pilot studies using video scenarios to test the practical application of the GENTS Taxonomy and gather feedback for further refinement.

ABSTRACT

Artificial intelligence (AI) engineers often lack awareness of the negative impact that AI systems can have on individuals' Human Rights and practices that can help to prevent such adverse consequences. Consequently, AI systems that contradict Human Rights values are common (e.g. Heikkilä 2022; Obermeyer et al. 2019). This workshop is designed to teach AI engineering educators about this shortcoming by focusing on four main outcomes. First, a real-life case study exercise demonstrates the potential of AI systems to harm the Human Rights of individuals and help participants identify the structural inequities of such systems. Second, participants are introduced to their role in creating Human Rights-respecting AI systems and fundamental considerations supporting this. Third, participants collaboratively identify bottlenecks they would face when implementing such considerations. Finally, based on these insights, we derive concrete interventions to overcome these roadblocks, from immediate actions to long-term goals and open questions. We hope that this

[1]*S. Kypraiou*
sofia@womenatthetable.net

workshop further aligns the Engineering practice with a Human Rights-based approach to AI development.

1 INTRODUCTION

1.1 Section 1

This workshop demonstrates the importance of developing artificial intelligence (AI) systems in line with Human Rights and collaboratively explores mechanisms that facilitate such a Human Rights-based approach to AI development. Through discussing case study examples, we evidence that AI systems have real-world impacts on the Human Rights of individuals. This is accompanied by an analysis of the structural mechanisms that cause these negative Human Rights impacts. In a second part, the participants reflect on their role in advancing Human Rights-based considerations, identifying current bottlenecks and blind spots. Harnessing their lived experience, we collaboratively identify technical and non-technical interventions to overcome the obstacles currently impeding the creation of Human-Rights centric AI systems. Our workshop aims at advancing the creation of technology centering equality and inclusion, thus extending beyond compliance to ultimately empower human beings and the public good.

The following sections provide more detail on the workshop's learning outcomes, content outline and timings, its relevance for Engineering educators, methods of interactivity, as well as the expected range and format of results.

2 LEARNING OUTCOMES

Our workshop is designed around the following learning outcomes:

- Understanding the core relationship between Human Rights and the creation and deployment of AI systems by exploring real-life examples where individuals' Human Rights were affected,making explicit the connection between the social, the technical and socio-technical, to address lack of familiarity with Human Rights frameworks and concepts in this context.
- Analyzing the mechanisms causing such Human Rights contradictions by reflecting on the objectives, impacts, and biases of existing systems (including those related to biased datasets, algorithmic design, and strategic choices) and through sharing a cohesive AI life cycle approach (Objectives & Team Composition, System Requirements, Data Discovery, Model Selection, Testing & Interpretation, Deployment & Auditing).
- Addressing the lack of focus on Human Rights concepts in engineering curriculum through familiarization with the Universal Declaration of Human Rights and professional codes of ethics (IEEE, ACM)
- Identifying promising technical and non-technical solutions and requirements that would facilitate the creation of AI systems centered around Human Rights, sharing resources with participants on fairness metrics, explainability techniques, human-centered design approaches, and multi-stakeholder engagement.

- Bridging the gap between technical and social science disciplines by demonstrating that these approaches are both complementary and necessary in the creation of Human Rights-compliant AI systems and by introducing the necessary technical and non-technical vocabulary for multi-disciplinary conversations.

3 OUTLINE: CONTENT & TIMINGS

Content Block I: Introduction to Human Rights - 10 minutes

- Speaker introduction
- The core values of Human Rights
- Introduction to the Universal Declaration of Human Rights

Exercise I: Case Studies Exploring Human Rights Contradictions of AI - 15 minutes

- Group exercise (3 to 6 participants per group)
- Each group reads SyRI case study* (see below) and are asked to discuss:
  - Which article(s) of the Universal Declaration of Human Rights were harmed?
  - What might be the cause of this impact? Think beyond biased datasets!
- Each group presents their insights briefly (2 minutes per group)
- As a group, we are locating entry points of bias along the AI development lifecycle

Content Block II: The Role of Engineers in Upholding Human Rights - 5 Minutes

- Introduction to professional codes of ethics that include respect for Human Rights, IEEE & ACM Code of Ethics
- Discussion on the responsibilities of engineering educators in teaching ethical practices and the educational challenges in engaging engineering students with ethical questions of this type

Exercise II: Reflecting on Required Information, Skills, and / or Tools - 25 minutes

- Group exercise: each group selects one stage of the AI lifecycle
- For this stage, they receive a list of reflective questions designed to support engineering educators in proactively protecting and promoting Human Rights in their work and teachings
- Groups discuss & reflect on:
  - Which of these Human Rights questions are easy to answer?
  - Which are hard or impossible? Why / What are the obstacles?

    - Which insights are required to reflect on these?
- Quick presentation of key insights of each group (3 minutes per group)

Summary - 5 minutes

- Summarizing learnings and introducing our free online course for interested participants
- Distribution of anonymous feedback form

Using the SyRI case study as a concrete example, we hope to provide workshop participants with practical insights and a clear understanding of how to integrate Human Rights considerations into their teaching. SyRI is an automated risk assessment system used to identify individuals who the system determined were more likely to commit benefits fraud (AlgorithmWatch, 2020). The system was deemed unlawful for violating the right to privacy under the European Convention of Human Rights (U.N. 2020) and for its impact on the Right of Social Service (Article 25) by employing a hidden algorithmic risk model exclusively targeting neighborhoods with mostly low-income and minority residents (Alston, 2020). The SyRI case also raises questions about bias in algorithm design and strategic choices such as lack of transparency and accountability that can hinder individuals from understanding and challenging AI-generated outcomes.

Overall, the SyRI case study provides a valuable opportunity for engineering educators to engage with the broader social and ethical implications of AI and to explore the role that they and their students can play in shaping the development of these technologies in a way that promotes Human Rights and social justice.

4 THEORETICAL FOUNDATIONS

A Human Rights approach to AI development centers the Human Rights principles of universality, indivisibility, equality and non-discrimination, participation and accountability at the core of algorithms (Fund 2005; Group 2020). Our goal is to integrate Human Rights principles into Engineering in order to advance the creation of AI technology that is aligned with Human Rights values rather than unwittingly harms them.

4.1 Why not Ethical AI?

Ethics, which are crucially important, are also situational (Jobin, Ienca, and Vayena 2019; Sadek et al. 2024). Ethical AI guidelines, authored by a wide range of bodies (e.g. academia, civil society organizations, research institutes, governments, and private sector organizations), are the currently most common response to concerns around the ethics of AI (Jobin, Ienca, and Vayena 2019). However, they are under major critique, both from academia (McNamara, Smith, and Murphy-Hill 2018; Munn 2023; Sadek et al. 2024) as well as the AI practice (Ibáñez and Olmeda 2022; Rakova et al. 2021). Their abstract nature allows for diverging interpretations and implementations, impeding or even undermining the determination of non-adherence and thus accountability.

We avoid this ambiguity by focusing on Human Rights: Human Rights are an agreed body of international (and national) law and reflect a universal understanding of aspects required to ensure human dignity (Assembly 1949; Rights 2024). Human

Rights thus provide a common and concrete starting point to align different actors, disciplines, and cultures. Consequently, we decided to center this workshop around Human Rights rather than AI ethics.

5 RELEVANCE FOR ENGINEERING EDUCATION

AI systems have an ever-increasing impact on all parts of society, including those connected to Human Rights. Examples include decisions around the detention of criminal defendants (Dressel and Farid 2018), social services and welfare (Chouldechova et al. 2018; Kawakami et al. 2022); recruiting decisions (Drage and Mackereth 2022; Mujtaba and Mahapatra 2019); or healthcare related matters (Obermeyer et al. 2019). Often, this can result in discriminatory outcomes, harming the Human Rights of individuals (Drage and Mackereth 2022; Obermeyer et al. 2019). Thus, it is essential that all roles involved in the development of such systems are aware of their responsibility and the mechanisms that can cause such harmful outcomes. This requires an understanding of how biases can enter the system along its entire pipeline (not just the training data), i.e. how the real world interacts with the technical measures that are an inherent part of AI development.

The second half of the workshop is dedicated to Human Rights-based considerations along the AI pipeline to equip the engineering educators with the tools and mindset to counteract such adverse Human Rights outcomes. To increase their actionability, this chapter is interwoven with reflections and discussions around their responsibility as well as the information, skills, and tools required to be able to act upon such Human Rights-based considerations. We believe that a deep understanding of the complementary nature of the different disciplines is required to enable a smooth collaboration - an essential condition for the development of Human Rights-respecting AI systems. The creation of technology is a multidisciplinary effort, strengthened by consultation, consensus, and diverse disciplinary perspectives including the lived experiences of the people affected by AI systems.

6 METHODS & INTERACTIVITY

The workshop is designed to address the specific challenges that engineering educators face in integrating Human Rights considerations into their work and teachings. These challenges include students' lack of familiarity with Human Rights frameworks, the perception of Human Rights as a non-technical or "soft" topic; difficulty in bridging the gap between technical and non-technical disciplines; and limited exposure to real-world AI applications and their impacts.

To address these challenges, the workshop employs interactive exercises that follow the Active Learning Theory (Fuson 2009). Theoretical content blocks I & II address the lack of the familiarity of the Human Rights frameworks and concepts, and are immediately put into practice into the next sections. The first exercise utilizes the SyRI case study as a real-world example (Herrington and Herrington 2006) to illustrate the potential impact of AI systems on communities. This addresses the limited exposure to real-world AI applications and their impacts (Buckley and Kukhareva 2021) helps to make the material more concrete and is a strong rebuttal to the perception of Human Rights as a non-technical or "soft" topic.

To bridge the gap between technical and non-technical disciplines, the workshop employs interdisciplinary collaboration (Yanitsky 2020) in a content block on the role of engineers in upholding Human Rights that promotes a more holistic and integrated understanding of the material. During the second exercise, we harness the lived experience of engineering educators to reflect on the challenges they experience in past and ongoing projects with regards to Human Rights considerations during the development of AI systems. We collect and aggregate current bottlenecks; an exercise required to understand current challenges, foci, and mindsets of AI Engineers. This knowledge can be used to create tailored interventions such as tools (Gebru et al. 2021; Holland et al. 2018; Mitchell et al. 2019), involving more Social Scientists to engage with affected communities, or setting longer timelines to be able to engage in reflective exercises. The exact interventions will depend on the bottlenecks that will be identified during the workshop.

This exercise also allows engineering educators to voice concerns regarding the practicability of a Human Rights-based approach to AI development. We believe that it is essential to involve all parties and affected communities in the creation of novel approaches to AI development to ensure that the resulting recommendations are actionable for all. Utilizing the Theory of Change (Brest 2010), the participants are incentivised to reflect on how they can promote Human Rights through their own projects. This spans aspects from identifying the desired Human Rights outcomes to actually planning the technical steps required to achieve those outcomes.

Through collaboratively summarizing the insights at the end of the session, we stress the ‘So What?’ of the session and derive concrete action points. We will use the last minutes of the workshop to introduce participants to our growing community that offers a free online course in Human Rights & AI, biweekly reading groups and meet-ups, as well as talks and community publications. We aim to be a multi-disciplinary community that is creating and trialing best practices for a Human Rights based approach to AI development in practice.

7 RESULTS

The following section provides an overview over the outcomes of the workshop held at the SEFI Conference on September 4th, 2024, with 12 participants working in or along engineering education.

We clustered our findings into three categories, which correspond to a step-wise action plan comprising recommendations for AI practitioners, regulators, and academia.

Immediate Actions. Insights in this category are interventions that could be introduced immediately by teams of AI practitioners. Our workshop participants reported that the real-world examples were promising in equipping AI practitioners with the sense of urgency and the critical mindset required to reflect about the risks of AI systems for Human Rights principles which could potentially be supported by tools such as AI Blindspots (Calderon et al. 2019). Here, the participants stressed the value of extending a risk-based approach (i.e. stressing the potential for harm of AI systems) to include a Human Rights-promoting approach, i.e. to focus on the ability of AI systems to help duty-bearers and rights-holders to realise and support Human Rights principles. Further, more technical and thus engineering-specific tools such as tools supporting data or model documentation (Gebru et al. 2021; Mitchell et al. 2019) were recommended by our participants to enable engineers to anchor the learned content more concretely in their daily practice and to motivate consistent application. Further, concrete reflections about the environmental impact of training algorithms on large datasets were considered to be useful to create a general awareness that code does affect the world we live in.

Longer-Term Actions. This category describes reactions that require some type of culture change or more planning and thus has more delayed outcomes. Our participants recognized the importance of community engagement but noted its difficulty to be applied in current design practices due to time and resource constraints (also found by Cave and ÓhÉigeartaigh 2018). Longer timelines, especially in initial stages of the AI pipeline such as during objective setting would be required to involve affected communities to reflect on their needs and collaboratively decide on the objective of a system. Further, teaching such community involvement was reported as challenging since most courses are classroom (vs project-) based, i.e. of theoretical nature. Encouraging students to consider non-technical solutions (i.e. how could the objective be achieved without or additionally to a technological solution?) was identified as a beneficial teaching method to unlock a less techno-centric approach.

Additionally, we found a severe lack of awareness regarding the requirements of recent regulations such as the Human Rights Impact Assessment (HRIAs) in the EU AI Act: participants with a very technical background were familiar with technical tests and audits but had not considered HRIAs. Since HRIAs are ideally conducted prior to creating any code (Leslie et al. 2022), the workshop participants concluded that a shift in focus and time allocation is required, i.e. to move from a main focus on code and technical measures towards early and ongoing involvement of affected communities. Here, the link to regulatory requirements was perceived as crucial to inflict such change.

Open Questions for Future Research. This category concerns open questions that have to be answered by academia before targeted interventions can be derived. Participants raised the concerns that the abstract nature of some Human Rights questions may not seem immediately relevant to technical tasks, potentially hindering student engagement. Human rights principles might be seen as too generic to be readily integrated into IT and software engineering training. Thus, we invite future research to identify pedagogical strategies that make Human Rights considerations more engaging and relevant to AI students, as well as more specific and actionable.

By identifying key considerations, barriers, and potential interventions, the workshop contributes to the further alignment of engineering practice with a Human Rights-based approach to AI development.

8 SUMMARY

Engineering educators have an especially crucial role in helping students develop ethical AI through their technical work and in teaching best practices to the next generation. The take-home message for session participants is that a Human Rights-based approach to AI development is essential for creating AI systems that are ethical, fair, respectful of human dignity. With the knowledge and skills provided in this workshop, participants will be able to integrate Human Rights considerations into their teaching and research, and contribute to the creation of AI systems that benefit society.

ABSTRACT

Building on the coherency of activities within the Special Interest Group (SIG), Engineering Skills SIG proposes a workshop with three distinct goals: (1) explore the usefulness of a method for determining the relative importance of different skills for future engineers, (2) discuss the skills framework proposed in the forthcoming SEFI handbook on teaching competencies & skills in engineering, and (3) generate "curriculum skills profiles" that can be further used to guide curriculum development. Participants of the workshop will be asked to sort skills proposed by the forthcoming handbook in a pre-set grid, and then reflect on their choices, definitions and implications in terms of the impact on teaching and coherence in institutional leadership. We will experiment with a hands-on method inspired by educational research, through which we will gain individual and collective insights. This will make the basis for a pertinent discussion on clustering and categorising skills. To generate results that we can all discuss within the workshop time, a simple visual analysis will be done aiming to create "curriculum skills profiles" that can inform curriculum development tailored towards educating a responsible engineer.

1 INTRODUCTION

Over several years, the Engineering Skills Special Interest Group (SIG) has engaged in understanding: the skills that students need to prepare them for the future, the stakeholders involved in skill development; and how different methods of teaching skills have been successful in different settings.

Following the skills survey launched by the Engineering Skills SIG during SEFI 2021, the SIG workshops facilitated at SEFI 2022 and 2023 focused on gathering insight into: the most relevant skills and the challenges involved in their teaching through joint discussions on “what”, “who” and “how” perspectives[1]. This work resulted in an overview of the most important professional and technical skills regarding the disciplinary background of the participants and the country of their home institution. Most needed are communication skills and system thinking skills - across all disciplines. We also inquired which skill might be least relevant and found that these are skills that can be delegated to a specific position, i.e. data, cyber, and network security might be provided by a professional and therefore must not be ensured by everybody within an organisation. Lastly, we discussed which skills are emerging and will become most relevant in the future. Here, we found that results rely more heavily on context but generally may be clustered as interdisciplinary and teamwork skills as well as professional responsibility including ethical, social, technological, intellectual, and global responsibility.

Within the SIG, through a collective generation of knowledge, we are also aware that there are other skills frameworks, each fitting their purposes, for instance:

- OECD Key Competencies [2]
- Future Skills [3]
- Education for Sustainable Development [4]
- European Commission’s Lifecomp [5]
- European Unions’ GreenComp [6]
- Inner Development Goals [7]

While these frameworks work well in their context and for the intended purpose, evidence from education sciences points both to the necessity to combine the context with the reform, and to the role of stakeholder engagement in enacting changes to teaching [8]. With this in mind, the workshop proposed an experimental technique to potentially profile the specific engineering discipline, or an entire institution, and provided an appropriate proposal of skills development based on the evidence-based profile.

In the workshop, we combined two things: a list of skills proposed in SIG’s forthcoming SEFI “Handbook on Teaching Competencies & Skills in Engineering” (working title), and an experimental workshop design for sorting skills to understand how they can be clustered and spring the conversation towards potential disciplinary or institutional profiling.

2 WORKSHOP DESIGN

Inspired by Q methodology [9], the workshop used Q sorts to inspire participants' subjective reflection on how to assign importance to a set of skills in a sorting tool (Figure 1). The tool works with fixed distribution and invites participants to place the input where they find it best suited.

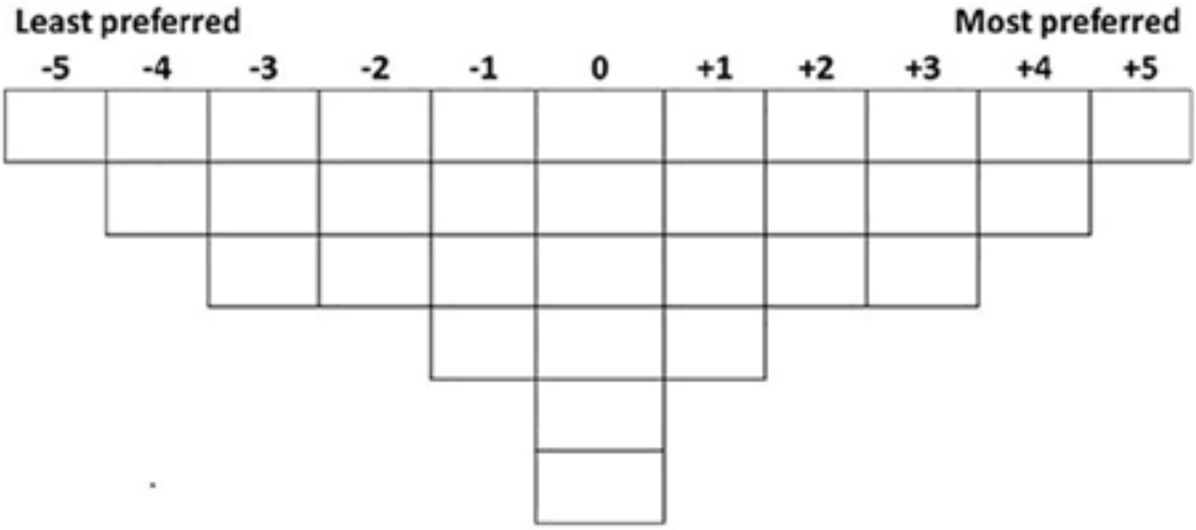

Fig 1. The distribution grid for Q sorts

We used the input of one of the core activities of the SIG, the forthcoming Handbook proposal, and instead of statements (which would be the usual approach in Q-methodology) we asked participants to sort skills based on their subjective understanding of the skill and terminology. The input was the skills selected by the Handbook working group.

The skills were colour-coded based on skill groups suggested within the Handbook. This stimulated the discussion about the different clustering and profiling of skills.

Workshop outline:

Activity	Description	Time
Introduction	Welcome to the session and a brief introduction to the Engineering Skills SIG and the outline of the workshop.	5’
Sorting	Participants receive pre-prepared sorting grids and sets of skills as input for the sorting activity. Participants take time to individually sort the skills.	10’
Arranging	Each participant lays out their input so that there is an overview of all of them (depending on the physical space, it can be a table, floor or empty wall)	5’
Collaborative analysis	First glance at the outcomes and thoughts on what the input can show us	10’

Discussion	Deeper discussion on meaning of skills, skill combinations, profiling	20’
Closure	Take-aways for individuals, Engineering Skills SIG, and institutions	10’

3 RESULTS

This workshop aimed to attract practitioners, researchers and students who wish to reflect on our choices when assigning importance to certain skills and how those choices might help us describe curriculum profiles. It also invited participants to peek into the forthcoming Handbook and support its further quality through a peer discussion.

Typically, the results of the Q-sort involve a physical distribution of sorted objects, and they can be followed up with a 'think-out-loud' narrative or a discussion. Even though we had an engaging group discussion to try to visually cluster the “curricular profiles” after the individual Q-sorting was done, we did not document all of the group discussions systematically. We thus focused on the collected skills Q-sorts from 25 participants. The workshop participants included engineering education practitioners, researchers, and a few students. We used a free web tool for visualizing clustering of multivariate data called ClustVis [10], to generate heatmaps and identify potential clusters among the skills profiles as well as skills groupings. The tool itself also creates a Principal Component Analysis (PCA) plot, which shows no obvious clusters, mostly because the data shown here contains only 18 points (Figure 2).

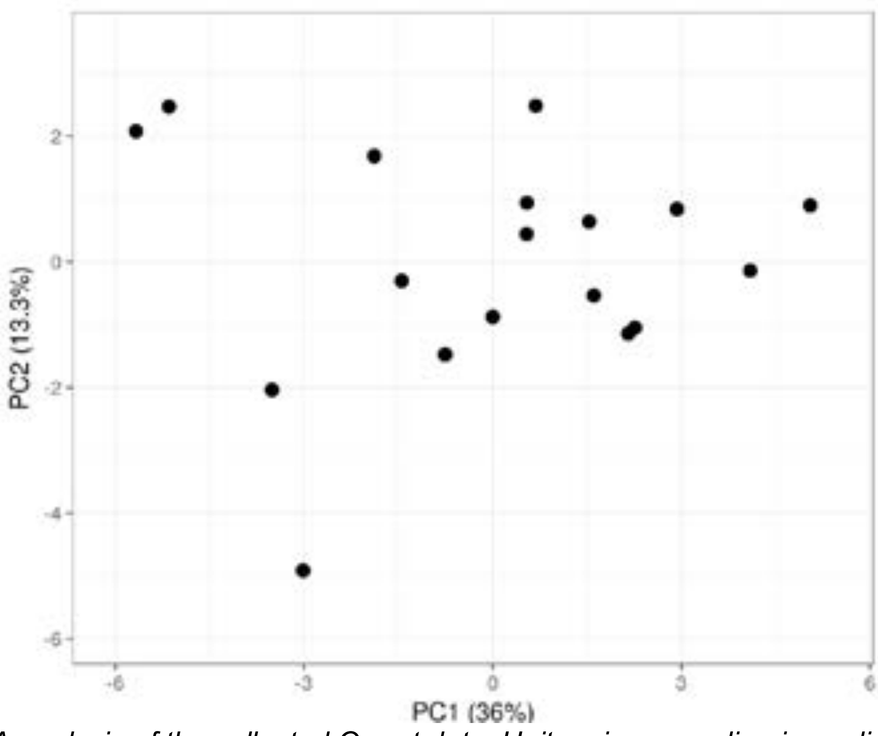

Fig 2. PCA analysis of the collected Q-sort data. Unit variance scaling is applied to rows; SVD with imputation is used to calculate principal components. X and Y axis show principal

component 1 and principal component 2 that explain 36% and 13.3% of the total variance, respectively. N = 18 data points, corresponds to the 18 skills given as an input for Q-sort

We proceeded to do a hierarchical clustering of the data, using the Euclidean distance and Ward's method, often recommended for Q-sort normally distributed data because it focuses on minimizing variance, which aligns with the distribution characteristics. The clusters of both dimensions (skills and respondents) were merged based on minimizing the increase in total within-cluster variance after merging, allowing us to see compact clusters. The use of Euclidean distance is sensitive to outliers and emphasizes differences in magnitude, which we assume we might have both when thinking of a diverse set of 25 respondents, and the 18 skills that were proposed. Finally, we forced the creation of 4 clusters, on both axes. Other combinations can easily be deciphered from looking at the dendrograms, tree-like linkage visualisations between different skills and respondents.

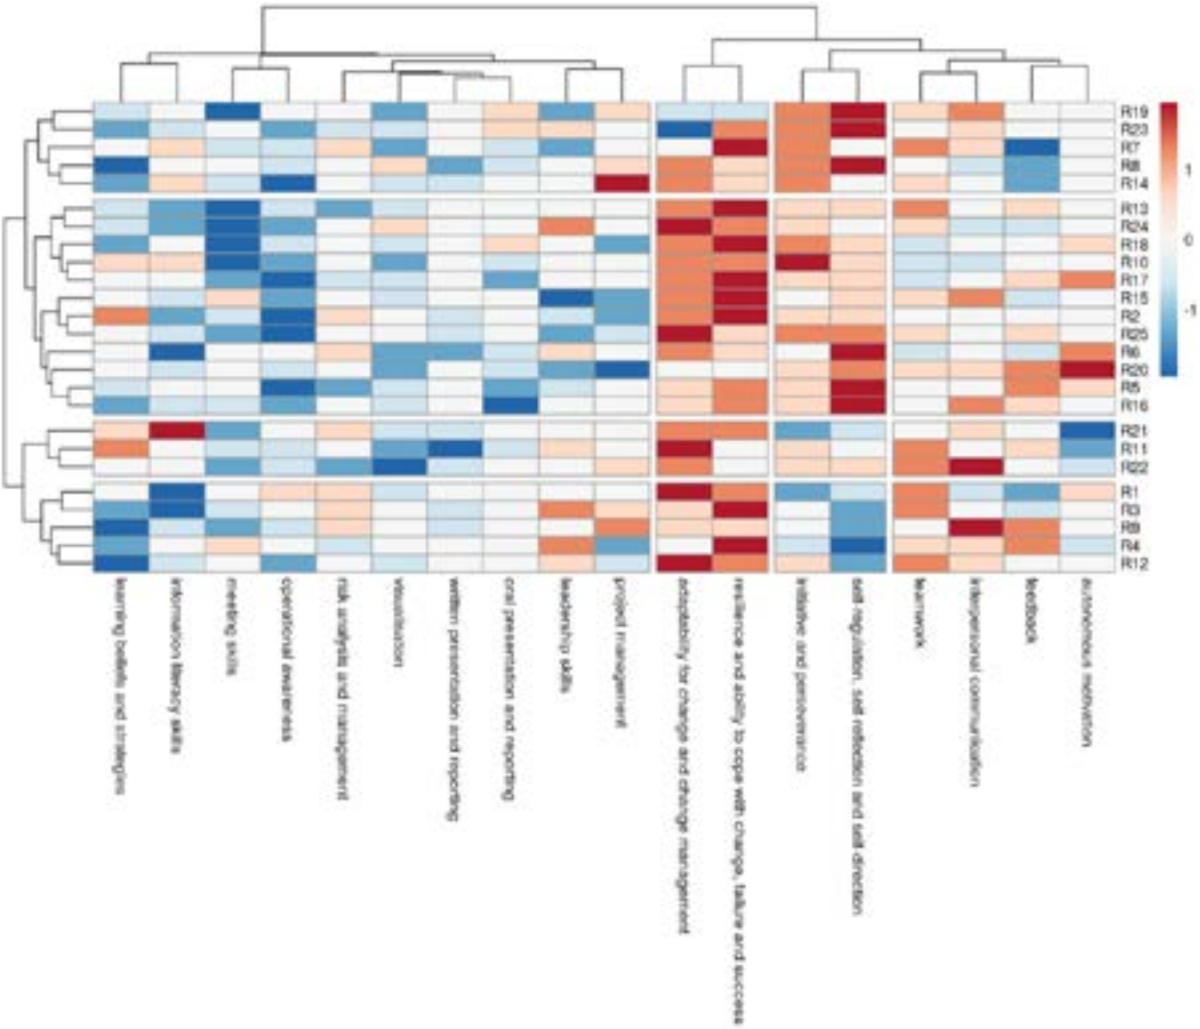

Fig 3. Hierarchical clustering of the collected Q-sort data. Euclidean distance and Ward's method were used to generate the heatmap and dendrograms to force the clustering of skills and respondents into 4 clusters each. The heatmaps represent the answers of each respondent - from dark red which indicates greatest importance (+3), over white (0), to dark blue which indicates the lowest importance (-3) for each of the 18 skills

As seen in Figure 3, the clustering of the 18 skills into 4 clusters based on the data collected through Q-sorting shows the following:

1. **Adaptability for change** and **resilience** are grouped together and shown to be by large the skills respondents found the most important
2. **Initiative/perseverance** and **self-regulation** are also grouped together and deemed important, though only by roughly ⅔ of respondents
3. **Teamwork**, **interpersonal communication**, **feedback** and **autonomous motivation** are grouped together, and mostly deemed slightly important or relatively less important
4. **Learning beliefs**, **information literacy**, **meeting skills**, **operational awareness**, **risk analysis**, **visualisation**, **written and oral presentation** and **leadership** and **project management** are grouped together in the final cluster, which is deemed less important.

This clustering reveals that some of the skills proposed in the Handbook might be merged, as they might be considered very similar or indistinguishable. It might also be used to revise the suggested grouping of skills proposed for the Handbook.

Looking at the potential "curricular profiles" that we might decipher from the 4 clusters of respondents, we can see the following:

1. The most different group (5 respondents) highly values **initiative/perseverance** and **self-regulation,** followed by **teamwork, interpersonal communication, feedback and autonomous motivation**.
2. The group that is very closely related (3 respondents) differs from the previous one because of their emphasis on **learning** and **self-regulation**.
3. Large cluster that contains two groups (12 respondents and 5 respondents) put a lot of emphasis on **initiative/perseverance** and **self-regulation,** and **adaptability for change** and **resilience.** The difference between these two groups is the relative importance of **teamwork**, **interpersonal communication**, **feedback** and **autonomous motivation.**

We can start to suggest that if we take out the overall perceived high importance of dealing with change in all groups, "curricular profiles" could be focusing more on self-regulation, self-reflection and self-direction on one hand, or on skills related to the capacity to work in a team.

The workshop provided individual participants to experience and explore the simplified Q-sort method applied to working with engineering skills, as well as discuss attitudes, definitions and general implications when it comes to skills selection. Another outcome was also examining potential skills profiles, ways of clustering and making frameworks and how the method for sorting can help institutions set an aligned approach towards skills, which was done in a discussion.

For the Engineering Skills SIG, the participants of the workshop contributed with giving first-hand feedback on how the skills proposed in the anticipated Handbook are perceived by a larger SEFI community, generating the first examples of skills profiles that could serve as templates to rethink curriculum design, as well as exploring which skills are seen as the most important ones towards educating a responsible engineer. Beyond these, the workshop showed the potential to test the skills discussed in the forthcoming Handbook as valid for other participants who are not part of the Engineering Skills SIG.

ABSTRACT

At the SEFI conference in Dublin 2023, we presented a paper on our experiences over a period of seven years in setting up a centre for educational development at the Norwegian University of Science & Technology (Lyng et al., 2023). The paper identified barriers and success factors found to be particularly important for establishing and successfully running such a centre. Taking our experience as a starting point for this workshop we will explore what needs, challenges, and opportunities are common to such initiatives.

In two group activities during a one hour workshop participants discussed expectations, experiences, challenges, and opportunities for achieving positive impact. We rounded off the workshop with a list of perceived obstacles and challenges among staff at our university, which we discussed in plenum.

The objective of the workshop was to initiate the establishment of an informal network of educational development units and other interested parties, and to learn from each other in order to promote even more positive impact of such centra.

1 INTRODUCTION

1.1 A Centre for Engineering Education Development – Rationale

At the SEFI conference in Dublin 2023, we presented a paper on our experiences over a period of seven years in setting up a centre for educational development at the Norwegian University of Science & Technology (Lyng et al., 2023). The centre, named Centre for Science & Engineering Education Development (SEED) had originally (in 2016) been very small with only one person associated with it, and had grown slowly over the period.

Among the outcomes of the strategic development project Technology Education of the Future running over several years for the University's STEM-portfolio, the responsible faculties identified a need to improve the educational quality and strengthen the educational competence among academic staff (Øien & Bodsberg, 2022; FTS, from the Norwegian: Fremtidens Teknologi Studier). Top quality engineering education requires that the academic staff be given opportunities to continuously develop their competence, not only in their research fields, but also, critically, with respect to their pedagogic skills and competences. The existing educational support and training had been valued but fell short of the ambitions for the redesign of the educational quality culture. The existing unit for educational support (SEED) was re-organized, upgraded, and more resources allocated.

Considering the range of factors that affect the quality of higher education, it is desirable to share experiences about issues such as capacity and recruitment challenges, coping with diverse faculty cultures, and the need for a shared vision in which to anchor activities and resource use. In our work two particularly pertinent factors for establishing the centre have been identified (Øien & Bodsberg, 2022):

- Who should be invested in the centre's mandate and responsibilities? Which are the interested parties, from the leadership on down, that need to agree on what the engineering programme portfolio and closely related education programmes should achieve?
- How can such a centre be closely aligned and in continuous dialogue with the pedagogical development strategies of the university's study programmes?

Given these two factors, an educational development centre needs to strategically plan and prioritize its resources, and develop its own capacity and competence, to provide support for education-related competence development. To this end, the university needs to develop its systemic and administrative routines to actively support educational quality development, with the centre being able to provide advice in this work. This is in line with Havnes & Stensaker (2015): 'the educational development centre is on its way to be transformed from a merely technical activity focusing on how individuals become good teachers, into having a broader focus in which the organisation, frameworks and infrastructure surrounding the teaching and learning experience is addressed.'

This workshop aimed to set our experiences into perspective as we continue to discuss experiences from the initial stages of recognizing the need for such a centre, to the on-going requirements of successfully running an established education development unit. We also discussed the matter from the perspective of the university's academic staff and perceived obstacles to change.

2 WORKSHOP STRUCTURE

2.1 Intended Learning outcomes and Motivation

The participants in this workshop discussed and reflected upon the need and use for a Centre for Engineering Educational Development, as well as the requirements and challenges of running such a centre, in order to establish a common ground for discussion during the workshop of perceived obstacles and challenges for continuous educational development. The workshop consisted of an introduction to the issues at hand, followed by individual work, group discussions and plenum discussions, before a summary.

First activity (10 minutes):

The participants were asked to discuss in groups and write down their suggestions on:

- What do you expect from an Engineering Education Development centre?
    - What are the specific functions and competences needed in order to establish an Engineering Education Development centre? What staff competences are desired or needed? What staff support is desired or needed? How can such support be provided?

The activity was designed to focus the participant's minds on the question of the desired functions and support of such a centre. Among the suggestions discussed were:

- A general recognition of the desired practical support for teachers, including *"Teaching practical skills to teachers"*, establishing a *"Mandate to teachers to develop"*. It was pointed out that this included the need to *"Scaffold and support [of] new teachers with a team to begin with"*, and that the centre needed to *"Be available both to individual teachers and programs/departments"*.
- It was also recognized by the participants that it was desirable to work towards *"Changing attitudes towards teaching"*, simultaneously recognizing that there often is *"Not more money for good education – (only) for research"*.
- A third point made was the need for a centre to be seen as *"Collaborators"*, and that this required both having *"Critical mass"*, and being *"Credible – […] Academics will listen more to physicists (say) teaching physics than education specialists"*.
- Finally it was considered necessary to have *"Faculty buy-in"*.

Second activity (25 minutes):

The participants were again asked to discuss in groups and write down their suggestions on:

- If you wish to develop the teaching competence of educators and the overall quality of education… What may the practical barriers & challenges be?

After the group discussions we discussed the (many) points made before continuing with a presentation in plenum of our own experiences from asking the staff at our university the very same question. The participant's engagement made for a lively discussion where the second part of the workshop became a dialogue on the subject. We presented the outcome of a similar exercise at our university, where we had asked teachers, study program leaders, heads of departments, and faculty leadership about their views on barriers and challenges. Here we present the answers from our staff at NTNU together with the comments from the workshop at SEFI.

The most common perceived barriers and challenges identified by SEED at NTNU can be grouped in five categories:

1. Lack of *time* and *resources*
2. Unsuitable *administrative routines and systems*
3. Too few systemic *arenas* or *fora* for organizational dialogue
4. Strong tradition for *course- and content-driven* development
5. Culture for privatized and individualized course development and execution

The comments made by the participants at the workshop were in good agreement with these categories, as can be seen below.

Lack of *time* and *resources* – both on a systemic level and for individual educators (teachers and programme managers).

When we looked closer at the comments made by staff at our university we found that the stated lack of time and resources could to some extent be understood as vicarious arguments for other underlying phenomena, at least partly, such as a lack of prioritization ('Research is more important'); or a lack of education-related competence ('We don't know what to do, or how to do it'); or a lack of understanding of the overarching FTS message ('The FTS reports are so long and complicated'); or, finally, a lack of motivation ('I don't think this is really necessary'). Or possibly, a mix of all of these underlying phenomena.

The points made by our staff was clearly reflected in the comments made by the participants during the group session in the second activity:

- *"Time: Teachers don't have time to work on education innovation"*
- *"Academics don't want to spend time on teaching –give me skills to do 'just enough'."*
- *"Resistance to collaboration, because it takes time"*

The participants also identified the challenges involved in reaching teaching staff with offers of support: *"We always get the usual suspects – hard to get those who need it"*,and *"Difficult to get attendance to trainee".*

It can be argued that there is a need to further investigate the underlying aspects of "Lack of time and resources" if support is to be tailored to the actual needs of staff and organisation.

Unsuitable *administrative routines and systems*

This includes unclear roles and responsibilities in some educational quality processes, and mismatch between roles, mandates, and responsibilities and the time, resources, and incentives available, in particular for study programme directors. Also mentioned was the design of current support systems, quality system routines, and process deadlines which do not support and sometimes even counteract, the desired systemic changes outlined in the project Technology Education of the Future (the FTS project).

The participants at the workshop echoed this, identifying the need for:

- *"Silos for edu[cational] support, innovation, and research [that] borders faculties"*
- *"Status of education"; "Reward and recognition"; "HR and rewarding"*

This is an aspect that has also been highlighted by the work on Curriuculum Agility, published by Suzanne Brink et al. (2024), where several organisational aspects of Curriculum Agility have been identified as important aspects of educational development.

Too few systemic *arenas* or *fora* for organizational dialogue

An aspect identified by our staff is the need for systemic meeting places for organisational dialogue, which effectively hinders learning across departments and faculties about educational development, in turn contributing to a lack of common understanding and hindering development of a common quality culture.

The participants at the workshop identified the need for

- *"Bringing teachers together to take initiatives together"*
- *"More talking and dialogue to get people together to form a culture"*
- *"Platform for sharing knowledge" and "Network[ing]"*

Strong tradition for *course- and content-driven* development

In addition our staff acknowledged a strong focus on courses and contents, rather than the *programme- and competence-driven* development advocated in the FTS-project recommendations.

The participants at the workshop recognized this or similar challenges as follows:

- *"Atomisation of courses"*
- *"Course [lacks] link to curriculum"*
- *"Segregation of courses makes overall quality development time-consuming"*
- *"Difficult to get good connections between courses – due to autonomy (closed doors)"*

This tradition is also strongly associated with a culture characterized by strong individual teacher autonomy, leading to what might be called ‘privatisation’ of teaching duties and course development:

Culture for privatized and individualized course development and execution

Here the participants were clear that often occurring mindsets presents additional challenges:

- *“Barrier – Culture of individual lecturing”*
- *“No one should tell me what to do and how to do it!”*
- *“Thinking that you have to teach the way you were taught (or that is the only way).”*

The participants also pointed out challenges that arose from the need for teachers to engage in lifelong learning as teachers, as exemplified by *“Students being more advanced in AI, etc.”*, *“Teachers with limited competence outside their discipline”*, and *“Teaching out of area”*, as a result of the focus on content within the teachers discipline only, rather that the need for our students to master the discipline in the context of their professional learning outcomes for the programme.

Overall, the comments made by the participants and the comments we collated from our staff were in good agreement with respect to perceived obstacles and challenges for educational support and development. It is clear to us that there is a need not only for such educational support units that we have established, but also that it is necessary to address also systemic and organizational obstacles and challenges for lasting and sustainable development to take place, and also that creating a network of educational support units between universities is desirable.

Final activity (5 minutes):

We collected contact information and invited the participants to contact us in order to initiate the sharing of experiences on all aspects of establishing, running, and developing an educational support centre. We are happy to report that a first meeting will take place during October of this year, and that we hope to come back with a report from our activities at the next SEFI conference in 2025.

ABSTRACT

Successful transition into doctoral degree programs is critical to helping students tackle the challenges germane to this degree and completing their degrees in a timely manner. However, the specific challenges vary as graduate education depends on contextual factors such as discipline, department, institution, and local, national, and international educational environments. Accordingly, a variety of resources and strategies have been implemented to support students within the transition to doctoral degrees. However, little research has emerged regarding what works in specific contexts and why. This workshop provides a starting point for developing this understanding by promoting conversations on practices currently used at both the individual advisor level and the department, college, university, etc.

matushm@vt.edu

(hereafter referred to as institutional level) to support students in transitioning into doctoral degree programs.

1 MOTIVATION AND LEARNING OUTCOMES

1.1 Motivation

Doctoral education remains critical to scientific advancement across all domains, including engineering, as outcomes include people prepared to engage in research and the research products themselves (e.g., European University Association 2022; National Academies of Science Engineering and Medicine 2018). However, the doctoral journey is not always easy and requires attention as to how we support students in skill development and degree completion (e.g., European University Association, 2022; National Academies of Science Engineering and Medicine, 2018, National Science Foundation 2023). Successful transition into doctoral degree programs is critical to helping students tackle the challenges germane to this degree and completing their degrees in a timely manner. However, the specific challenges vary as graduate education depends on contextual factors such as discipline, department, institution, and local, national, and international educational environments. Accordingly, a variety of resources and strategies have been implemented to support students within the transition to doctoral degrees. However, minimal research has emerged regarding what works in what contexts and why. This workshop provides a starting point for developing this understanding by promoting conversations on practices currently used at both the individual advisor level and the department, college, university, etc. (hereafter referred to as institutional level) to support students in transitioning into doctoral degree programs. While organizations such as the Council of Graduate Schools in the United States and European University Association in Europe discuss graduate education across all disciplines there is less focus specifically on engineering.

1.2 Learning Outcomes

As a result of this workshop, participants will be able to:

- describe resource/support needs for different student populations transitioning into doctoral programs;
- articulate ways that individuals and institutions can support students transitioning into doctoral programs; and
- identify approaches to support students transitioning into doctoral programs already being used by others that may be salient to their own context.

2 BACKGROUND, RATIONAL, AND RELEVANCE

Helping students successfully complete doctoral degrees in a timely manner requires supporting students in getting off to a good start. This includes helping students understand the doctoral degree process and expectations. However, this seemingly simple idea is complicated by the fact that doctoral programs and doctoral student experiences are variable and depend on contextual factors such as discipline, department, institution, and local, national, and international educational environments (e.g., Becher & Trowler,1989; Biglan,1973; European University Association,2022; Ferrer de Valero 2001; Gardner 2009, 2010; Golde 2005). Differences in doctoral experiences are also found based on student characteristics such as background and demographics (National Academies of Science Engineering and Medicine 2018). For example, studies on graduate education in the United States have shown that doctoral engineering degree completion rates are lower and degree completion takes longer for historically marginalized students (National Science Foundation 2023). These differences mean that there is not a one-size-fits-all approach to developing resources and supports for doctoral students, consequently different approaches may be needed in different contexts and/or for students with different background characteristics.

Accordingly, a variety of support programs and resources have emerged that focus on this transition period. For example, Tufts University in the United States has a news article promoting the importance of getting off to a good start and sharing campus resources: https://asegrad.tufts.edu/news-events/news/transitioning-your-graduate-program-importance-time-management-and-self-care-graduate-students. Similarly, the University of Saskatchewan has a resources website: https://cgps.usask.ca/onboarding/transition/transitioning-to-grad-school.php. An Australian University has a program called Transition In which is embedded in their curriculum (White 2023). Columbia University has a Bridge to the Ph.D. in STEM Program (https://bridgetophd.facultydiversity.columbia.edu/) that is a support program outside of the curriculum. Recognizing the important role of the advisor in the doctoral journal, programs such as the Center for Improvement in Mentored Experiences in Research (CIMER, https://cimerproject.org/) focus on improving individual mentoring.

Because transition is recognized as critical, programs have also emerged to incentivize universities to create and provide transition support. For example, the Bridge to the Doctorate competitive funding opportunity provided by the National Institutes of Health in the United States encourages development of support programs for students. As another example, our research team has created a train-the-trainer program to help engineering colleges run a program that prepares historically marginalized doctoral students for the transition to the PhD. Our particular program [name de-identified for review] consists of workshops are intended to be held just before students start their graduate programs and into that first Fall semester. This workshop structure was designed and grounded in research on doctoral student development and has been tested across multiple institutional contexts for replicability.

Even with a structure designed to support students, and to motivate institutions to do so, what effective and appropriate support should look like remains a moving target. The graduate education landscape is constantly changing and there is a need to continually examine which students the support programs are serving, how the students are being served, and whether it is effective. To that end, this workshop provides an opportunity for researchers, educators administrators and graduate students to engage in an international sharing of practices regarding helping engineering students transition into doctoral programs. By collaborating across geographical, institutional, and disciplinary boundaries, we hope to challenge participants to think creatively and perhaps challenge perceived constraints by sharing ideas that work for students from different backgrounds and in a variety of contexts.

3 WORKSHOP DESIGN

Because graduate education is not a one-size-fits-all endeavour, this workshop has been designed to engage participants in rich, interactive discussion on effective means for helping graduate students transition into doctoral degrees in engineering. The timing and content of this 60-minute workshop are as follows:

5 min — Welcome and Overview: Introduction to the workshop and establishing a shared definition for supporting students transitioning into graduate school.

10 min — National Contexts: Input from audience members to identify national/regional contexts and demographic considerations relative to degree requirements for graduate education.

5 min — Intervention Results: Brief description of our intervention structure, outcomes to date, and challenges emergent from changing political climates in the United States.

15 min — Small Group Discussion and Sharing of Ideas and Practices:

- In your research group/lab, how do you help students transition into doctoral work? Why do you take this approach?
- What programs/resources exist in your department, college, university, etc. to help students transition into doctoral work?
- What current contextual factors, if any, are influencing your approach?
- What supports/resources do you wish existed for your students?

15 min — Reporting out from Small Groups Discussion and Sharing

- Create a collective list of individual and institutional resources and practices;
- Identify shared and unique contextual factors influencing on-boarding practices;
- Generate a list of support needs/opportunities.

10 min — Next Steps: Opportunity for networking across institutions and contexts to learn more about specific ideas or practices.

4 RESULTS OF THE WORKSHOP

Our workshop had a small but engaged group of participants from multiple universities. Country contexts included the Czech Republic, Sweeden, Switzerland, and the United States. Participants represented various roles within higher education including administrative, faculty, and graduate student.

Collectively the group identified individual support systems for helping students transition into the PhD including lab/research group meetings, setting expectations and practical guidelines for degree success, and ensuring sufficient mentoring which is sometimes scaffolded by postdocs or peer graduate students. Department, college and/or university resources included voluntary or compulsory seminars or classes for students that introduce topics such as ethics, publishing, scientific writing, and effective ways to engage with others, departmental level mentoring programs, and a welcome center focussed on supporting international students.

A common context participants considered when developing support practices are the needs of international students and helping them navigate language barriers and developing understanding differences in administrative processes. A unique context discussed extensively is one where students are hired by the University as junior colleagues and faculty advisors engage in significant training and apprenticeship before they advise such students. This sits in contrast to models where individual faculty or units fund/support students.

Regarding desired support systems for helping students transition to the PhD, participants agreed that more institutional support is needed. Specific ideas included centralized professional development, more time allocations for supervising graduate students, and offering a fellowship year so students can focus on their own needs and getting off to a solid start.

At the end of the session, we asked participants to indicate one thing they learned that they would continue to think about. Several participants indicated learning about other contexts and specifically advisor training and expectations and reasons students pursue degrees and/or drop out of degrees in different settings. Participants also recognized a need to set expectations for students and for faculty in advising processes as well as considering the tension of graduate students as students but also as University employees and how some contexts prioritize one over the other.

5 SIGNIFICANCE OF THE WORKSHOP

With constantly changing political landscapes around the world, this workshop will provide an important avenue for sharing of ideas for supporting students in the transition into engineering doctoral programs that cross local geographical, institutional, and disciplinary boundaries. We generated a collection of practical approaches that engineering education stakeholders (faculty, administrators, graduate students) can leverage and adapt for local use.

6 ACKNOWLEDGEMENTS

We acknowledge this work is the outcome of a collaborative project and recognize our team members not listed as authors: Drs. Mayra Artiles and Gwen Lee Thomas, and Cheryl Summers.

ABSTRACT

In a world facing complex challenges intertwined with contradicting goals from diverse stakeholders, training responsible and career-ready engineers is paramount. Intensifying career-readiness dialogues is critical for addressing global challenges and fostering disruptive innovations. A study by NACE[3] (National Association of Colleges and Employers) and a Human Resources Development framework by Boston University[4] revealed new graduates are commonly found lacking in critical thinking competency when compared to entry level professionals; a gap it typically takes five to eight years to overcome. A SEFI 2020 Concept Paper by Kovacs et. al.

of the EPFL[5] further confirmed the importance of solving this challenge particularly highlighting the importance of intensifying transversal skills training.

This workshop will explore the role of information literacy and the students' ability to discern relevant sources of information responsibly for the development of their critical thinking and the overall career-readiness. The aim was that via a series of moderated discussions, participants would gain a deeper understanding of career-readiness and strategies for training responsible use today's digital tools including Extractive and Generative AI to close the aforementioned competency gaps.

The workshop was hosted and moderated by Elsevier's Mark Natanael, Senior Global Product Manager, and Marta Bracha, Account Manager/Engineering & Geoscience. This report covers the main elements of presentation, discussion, conclusions during the session and additional reflections from the workshop moderators.

1 INTRODUCTION

1.1 Rationale and Learning Outcomes

Chasing career readiness has been an elusive journey for engineers in training and their educators. "What is career-readiness?", "Am I 'Career-Ready'?", "How should one train and mentor career-ready and responsible engineers?"; this workshop is designed to host discussions surrounding the questions above. The objectives of this moderated workshop are as follows:

- Communicate findings on career-readiness study by NACE, Boston University and Elsevier
- Surface the challenges in training students to overcome the largest competency gaps between new graduates and experienced professionals
- Share innovative teaching/training methods that utilize today's digital technology landscape responsibly during the open discussion
- Produce agenda for future dialogues to address unresolved challenges.

1.2 Motivation for Attending SEFI and Organising the Workshop

For Marta the main reason for wanting to attend the SEFI conference and organise a workshop in 2024 was to learn about the importance of information literacy and critical thinking to the engineering educator community. For Mark it was essential to highlight the connection between information literacy and producing ethical and career-ready engineers in the age where responsible information gathering is necessary to combat misinformation as part of one's critical thinking competency. So, the moderators were interested to learn more about the challenges in training for information literacy and information gathering, particularly as this relates to the shared responsibility between libraries, faculties and industry.

The workshop idea came from the overlap between the NACE study on critical thinking competency gap and an Elsevier career-readiness webinar, both converging on insights from academia and industry on the importance of information literacy for

[5] *H. Kovacs, J. Delisle, M. Mekhaiel, J. Dehler Zufferey, R. Tormey, P. Vuilliomenet. (2020). Engaging, Engineering, Education, SEFI 48th Annual Conference, University of Twente (Online), 20-24 September, 2020 - 88. Teaching Transversal Skills in the Engineering Curriculum: The Need to Raise the Temperature. SEFI. Retrieved from https://app.knovel.com/hotlink/pdf/id:kt013GMSC6/engaging-engineering/teaching-transversal*

career readiness. The aim was to identify two major challenges facing educators in this area, to describe some successes and failures, and to share two readily implementable practices.

2 METHODOLOGY

2.1 Workshop Agenda

- Introduction and Springboard Presentation (5 minutes).
- Small Working Group: take inventory of what career-readiness entails in terms of skills and knowledge (word-cloud) (15 minutes).
- Small Working Groups: share examples of challenges from own practice and one success and one failure in trying to overcome it (20 minutes).
- Panel: How can we incorporate the successes into current teaching practice? (20 minutes).

2.2 Introduction and Springboard Presentation (5 minutes)

The workshop starts with a short background introduction and presentation that communicates:

- Career-Readiness definitions by NACE and Elsevier.
- Largest competency gaps between new graduates and experienced professionals as highlighted by the NACE study and various Elsevier interviews with the corporate sector.
- Boston University Professional Development framework which outlines the typical timelapse for entry level professionals to grow into an autonomous contributor in their corporate setting.
- Elsevier Career-Readiness webinar findings which highlights the importance of the following needs:
    - Student training to handle failures.
    - Specialized training to gather and process data and interdisciplinary knowledge in the Extractive & Generative AI chapter of the digital era.
    - The importance of Project-Based-Learning activities (Capstone projects, academic skill competitions, etc).

2.3 Working Groups (35 minutes)

The small group discussions are designed to surface definition discrepancies, experiences and lessons learned from current career-readiness training methods and goals. The discussions will be structured around answering the following questions:

- What does critical thinking entail? (2 sentences)
- How do you currently train students to achieve critical thinking prowess? (2 success stories and 2 failed attempts)
- What are some of the most frustrating challenges you see in training the students? What have you tried that worked well in overcoming these and what have you tried that failed?

2.4 Closing & Summary (20 minutes)

The last 20 minutes of the workshop will be a facilitated discussion of findings in the plenary group with the goal of making an inventory of successful approaches.

The facilitators will ask participants to provide feedback as well as to express their interest in interacting as a group beyond the workshop setting with a view to sharing their challenges and experience with using tools and methods in the classroom to produce career-ready engineers more effectively.

3 RESULTS

3.1 Significance for Engineering Education

As the world's problems and challenges become more complex and intertwined with contradicting goals from the involved stakeholders, training responsible and career-ready engineers becomes more crucial than ever before. A study in the United States by NACE (National Association of Colleges and Employers) and Boston University identified that it typically takes five to eight years for a new graduate to be proficient as an independent and collaborative contributor in his/her organization. Incorporating career-readiness objectives into student training, with a focus on bridging competency gaps—particularly in critical thinking and problem-solving—between students and seasoned professionals, plays a crucial role in responsibly tackling global challenges, preparing students for the future, and nurturing disruptive innovations.

This workshop is designed to raise awareness amongst knowledge solution providers, information managers, librarians and educators in support of reducing the timetable for new graduates to achieve autonomy and high level competencies in their career journeys.

3.2 Challenges Shared by the Engineering Educators in the Workshop

Attendees joined from universities, schools of applied science and technology, and from industry, in Europe, Asia and North America. The two main challenges that came to light were how to train students in reliable thinking and how to take on board their attitudes towards training in general. Students tend to see educators as "all-knowing". Many of them just expect to receive instructions, check the rubrics and then produce a deliverable. But when they go into the workplace, the deliverable is actually a part of the solution where failure may occur.

In addition, many students are accustomed to consuming, not to criticising or questioning. They want to be on the receiving end of information and this hinders critical thinking in several ways. They may consider being critical or seeking out additional information as a waste of time as they are focused on passing their tests or exams quickly and efficiently.

3.3 Failures Shared by Participants

The idea of envisaging failure as an integral part of the engineering learning process is completely alien to many students who have only ever known academic success during their university years. As a result, they are particularly ill equipped to factor it into their professional approach when they embark on their careers. Faced with these various experiences educators must develop teaching strategies that take account of this lack of awareness. “Real readiness”, as one participant said, “is knowing what to do when you don't know.”

Participants also discussed the fact that staff at university libraries felt their role in gathering and analysing information and in teaching information literacy was not sufficiently recognised or acknowledged in curricula.

3.4 Potential Practical Solutions Proposed by Participants

The workshop agreed on the need for better promotion of collaboration between libraries and faculties. It is essential to inform them that all of us share a common goal to educate students on ethical/responsible information gathering and information literacy as part of their critical thinking training. One of the ways of doing this is to raise awareness of the specialized tools that are available to support more effective and efficient training in information literacy.

3.5 Challenges Shared by the Engineering Educators in the Workshop

Attendees joined from universities, schools of applied science and technology, and from industry, in Europe, Asia and North America. The two main challenges that came to light were how to train students in reliable thinking and how to take on board their attitudes towards training in general. Students tend to see educators as “all-knowing”. Many of them just expect to receive instructions, check the rubrics and then produce a deliverable. But when they go into the workplace, the deliverable is actually a part of the solution where failure may occur.

In addition, many students are accustomed to consuming, not to criticising or questioning. They want to be on the receiving end of information and this hinders critical thinking in several ways. They may consider being critical or seeking out additional information as a waste of time as they are focused on passing their tests or exams quickly and efficiently.

4 SUMMARY AND ACKNOWLEDGEMENTS

From the discussions emerging during the workshop, it is clear that educators need to use their academic freedom to develop strategies for teaching information literacy to their students that are specifically adapted to these students’ different experiences and competency levels. At a time when the dynamics of education and training are changing, educators must also learn when to step back from the idea of being an academic authority and consider themselves as co-developers, co-educators walking the path with their students – that takes courage.

The workshop confirmed that educators find the topics of career readiness and information literacy very relevant to their work. They are looking to explore further how industry and academia can work together to bridge the critical-thinking competency gap and how we can educate students to improve their skills in information gathering and analysis.

To do this, Elsevier plan to create more forums and discussion opportunities where industry insights can be shared within the academic community, and craft an agenda for future engineering education conversations on this topic. Their hope is that educators will actively look for the resources currently available on this topic and will contribute to such resource hubs where possible. One such example already available are the articles and guidance on the UK's Engineering Professors Council Ethics Toolkit (see below) which Elsevier were able to contribute to. Mark and Marta on behalf of Elsevier would like to thank the SEFI 2024 committee for enabling this valuable discussion and thought leadership conversations and would welcome the opportunity to collaborate with other organisations in this way.

ABSTRACT

ChatGPT and other Generative AI tools (GenAI) have generated much commotion and confusion within academic circles. Many academics still need to understand the risk such tools pose on current assessment practices and how students can use them for improved grades/outcomes. Unfortunately, most studies are very generic, do not go into much detail, and are outside of the engineering education context. In addition, GenAI provides many opportunities to construct novel, authentic and/or personalised learning experiences for students.

The workshop's facilitators have completed two comprehensive studies evaluating ChatGPT's impact on engineering education assessment (Nikolic et al. 2023; Nikolic et al. 2024). While strengths, weaknesses and opportunities were outlined, it is only the starting point for much-needed conversations. This workshop introduced participants to various GenAI tools in the context of a variety of engineering assessment types and engaged participants with a range of experience levels. We guided and engaged participants in exploring GenAI capabilities, in applying a framework for evaluating security and opportunities in assessment and through this demonstrated a model for professional development that they can adapt to their own institutions.

1 INTRODUCTION

The advent of user-friendly generative artificial intelligence (GenAI) tools is disrupting the conceptualisation and practice of engineering education. These tools offer users the opportunity to generate computer programs, reports, data analysis and even technical drawings with a few lines of natural language and limited knowledge of the field. Thus, educators, institutions and governments, accreditation and professional bodies are being forced to reconsider what it means to demonstrate learning, to assure competent graduates and even what learning is required.

There is significant current debate about how GenAI should be considered and employed. This debate joins a historical discourse that has paralleled the development of artificial intelligence (Bearman, Ryan, and Ajjawi 2022). Some frame these tools as a source of harm or disintegrity (Thorp 2023; Fischer 2023), while others see them as the dawn of a “post-learning era” (Siemens 2020). Then, of course, there is a significant spectrum of nuanced views in between (e.g., Lim et al. 2023; Yusuf, Pervin, and Román-González 2024). The tools obviously have an impact on the integrity of many current assessment practices (Nikolic et al. 2023) as well as providing exciting possibilities to create new learning opportunities (Chauncey and McKenna 2023). At the same time, concerns are being raised about these tools, for example about how they may impact student agency and metacognition (Abbas, Jam, and Khan 2024; Darvishi et al. 2024).

In our first benchmarking study (Nikolic et al. 2023), we evaluated the performance of ChatGPT 3.5 against assessment tasks drawn from a wide variety of engineering subjects. We discussed the implications for how different assessment types can be used to offset the risk of GenAI undermining assessment integrity and explored opportunities for using GenAI to support student learning. Given the rapid advances in GenAI’s capabilities, we have updated and expanded our work to assess a wider range of GenAI and developed an Assessment Security & Opportunity Matrix for analysing different assessment types (Nikolic et al. 2024). In parallel, we have completed a systematic literature review which synthesises evidence from recent research literature evaluating teaching interventions using GenAI (Belkina et al. 2024). During the workshop we briefly shared key insights from these studies in the workshop and equipped participants to apply these insights to their own assessments and teaching practice.

2 RATIONALE

There is a massive need for professional development of engineering educators to meet the challenges and opportunities presented by GenAI. Typically, there is a long lead-time between the take-up of new technology by innovators and early adopters, and its translation into the practice of the vast bulk of educators. With clearly identified weaknesses in current practice, and ongoing threats from constantly improving GenAI tools, educational leaders and leading educators must ensure that all their colleagues are able to navigate GenAI-enhanced education.

This workshop sought to empower attendees with the capacity to assess the impact and opportunities of GenAI on their teaching practice, as well as demonstrating a transferable model for the professional development of teaching staff in their own institutions.

3 LEARNING OUTCOMES

The objective of this workshop was that participants would be able to

1. Perform a risk analysis of their current assessment practice with respect to GenAI using an Assessment Security & Opportunity Matrix,

2. Identify opportunities for the integration of GenAI in their educational practice, and
3. Disseminate professional development for their colleagues on GenAI in assessment practice.

4 WORKSHOP PLAN

The workshop was designed for participants with a wide range of experience with GenAI. It was organised into four parts:

1. **Welcome and introduction (10min).** After welcoming and organising them into groups, the participants responded to an online open-ended prompt: "What do you think of when you hear AI and Assessment?". The presenters explained how the workshop was designed as a model for professional development, and then gave a mini lecture explaining how GenAI works, how to interact with it, and good practice approaches to writing prompts and interpreting output. The mini lecture was designed to help less knowledgeable colleagues get up to speed.
2. **Exploring GenAI capability to complete assessments (20min).** Participants were introduced to the evaluation process employed in Nikolic et al. (2023) and then worked in pairs to evaluate one of three assessment tasks using ChatGPT. Participants were also provided with an example prompt for their task. This was followed by small-group discussion at tables and then a debrief in plenary.
3. **Managing GenAI risks in assessment (20min).** Following on from the **Part 2** discussion, participants were presented with the Assessment Security and Opportunity Matrix developed by Nikolic et al. (2024) and its associated risk assessment method. Table groups then worked to evaluate the risk of GenAI impacting the assurance of student learning, as well as discussing controls to mitigate the risk. The discussions of the various groups were then shared and compared with the whole group.
4. **Conclusion (5min).** The presenters then summarised the workshop discussions and their connections to the concepts of assurance of learning, assessment validity and resilient assessment design. Finally, participants were encouraged to use the workshop materials at their own institutions – as are you, dear reader!

5 WORKSHOP RESULTS

The workshop was attended by approximately 25 participants. These participants were distributed across 6 table groups. When asked for their thoughts about GenAI and assessment, there were 40 responses from 17 participants. The responses reflected both positive and negative sentiments. The negative sentiments centred on concerns about cheating and academic integrity, while the positive responses included new efficiencies and opportunities in assessment. The discussion provided a moment to acknowledge the way GenAI is problematised and/or idealised, and to recognise that we need to engage critically with new tools.

Participants then engaged in the evaluation activity and each table was assigned one of three assessments:

- Position Paper – students critically analyse and respond to a newspaper article about a resource development project published in the last 12 months,

- Internship Reflection – students reflect on a critical incident in an internship and use it to inform future professional development, and
- Design Quiz – students complete five short answer questions about the engineering design process.

Even though the first two tasks incorporate elements recommended to promote academic integrity (e.g. currency, higher order thinking, reflection, reference to class discussion), the participants found that all tasks could be completed to a relatively passable standard by ChatGPT. The best responses were found for the Quiz, followed by the Position Paper. Here participants noted it would be hard to "distinguish spurious responses" as they GenAI at least superficially met the criteria.

The Internship Reflection task prompted a broader range of opinions. Some found that because no reflective framework was specified it meant ChatGPT guessed how to write the reflection and sometimes these guesses were unsatisfactory. Others achieved a better response by modifying the example prompt to include a competency framework. While still others questioned whether it was really cheating if the student provided all the reflection elements as bullet points and simply asked ChatGPT to put that information in the correct structure.

The second activity, applying the Assessment Security and Opportunity Matrix, demonstrated the benefits of the risk assessment approach. Given the familiarity of risk assessments in other fields, participants were able to rapidly understand the process and apply it to evaluating assessment tasks. The Position Paper and Quiz tasks were considered highly likely to be compromised by GenAI giving them Very High risk ratings, while the Reflection task was rated Moderate. Similarly, the participants could apply the control hierarchy to redesign assessment tasks. For example, invigilating students writing the Position Paper, substituting an interactive oral assessment for the Reflection, or redesigning the Quiz so that students critique AI response or instead submit their prompt for answering the questions.

Overall, the workshop produced lively and animated discussions with all participants engaged in the activities. Several participants found the risk approach was beneficial – rather than panicking or being paralysed by the threat of GenAI, this process provides teachers with a constructive way forward ("how to rethink my assessment"). Subsequent feedback has indicated that participants have recommended the approach to colleagues – achieving the dissemination of professional development outcome. Another participant commented that "The workshop was absolutely brilliant in a few respects: Firstly, [they] had a really clever design that quickly got participants engaged in highly relevant and thought-provoking tasks. Secondly, … they were able to [rapidly] connect us with the emerging findings of this project, and the focused challenges that are facing engineering educators."

6 SIGNIFICANCE

The rate at which GenAI technologies are advancing means there's a risk of a new GenAI digital divide arising between educators and incoming students, threatening the integrity of assessments and that curriculum loses relevance for workplaces where GenAI is ubiquitous. Thus, it's imperative we usurp the typical long-term propagation pattern of technology innovation, where early adopters are using technologies far in advance of them becoming common practice. This workshop contributes to that imperative i by developing participants' understanding of the challenges and opportunities of GenAI in engineering education and equipping them to share those insights with their colleagues.

1 INTRODUCTION

The public availability of ChatGPT and sophisticated generative AI (GAI) models has catalysed a wave of dystopic, utopic, and ambiguous discourses in the educational sector. On the one hand, there are optimistic visions about GAI's potential to revolutionize education though personalized learning and immediate learning support, enhanced educational access, reduced teaching workload, among others (Chan and Hu 2023; Dai, Liu, and Lim 2023; Farrokhnia et al. 2023). On the other hand, critical concerns have been raised about the technology and its embedded biases, environmental costs and issues related to copyright and data privacy.

[1] *Corresponding Author*
Sofie Otto *sio@plan.aau.dk*

Educational researchers also highlight the critical implications of GAI on assessment integrity and purpose, student misconduct, and negative impact on student development and growth due to overreliance (Chan and Hu 2023; Dai, Liu, and Lim 2023) as well as potential unanticipated problematic side effects like worsened discrimination and inequality (Williamson 2024). In response, some institutions have implemented bans or restrictions on GAI usage, while others have cautiously welcomed the adoption (Tlili et al. 2024). Regardless of approach, AI technologies are estimated to play an increasingly larger role in society and education (Grayling et al. 2023) as well as in addressing the pressing challenges of modern society (UNESCO 2021).

While the current body of rigorous and sustained evidence that supports practical outcomes of AI implementation in education is limited (Nemorin et al. 2023), researchers and educators are working out exactly what GAI means for teaching and learning (Miao 2023). At the same time, high levels of student GAI adoption have been reported (Chan and Hu 2023; Malmström, Stöhr, and Ou 2023; Sánchez-Ruiz et al. 2023), especially within science and engineering disciplines (Kelly, Sullivan, and Strampel 2023). This adoption is in several cases reported to be surrounded by uncertainty, issues of trust, and unclear academic integrity expectations as well as uncertainty regarding institutional policy, rules, and guidelines (Chan and Hu 2023; Malmström, Stöhr, and Ou 2023; Petricini, Wu, and Zipf 2023). Nevertheless, recent literature reviews on AI in education highlight the importance of educators adapting their teaching and assessment to ensure that students are equipped to engage with GAI technologies in a responsible and reflective manner (Bozkurt 2023; Wang 2023).

This one-hour workshop was grounded in the abovementioned complexities and uncertainties associated with GAI adoption in education, while acknowledging the diverse factors influencing the adoption of digitally supported learning, e.g., local learning environments, pedagogical approaches, institutional policies, technological advancements, discipline orientations, and the intricacies of students' interactions with content, teachers and each other (Otto et al. 2024). The primary objectives of the workshop were to:

1. Engage in a discussion and reflection on educational practices considering the disruption of GAI
2. Reimagine future educational practices by applying epistemic design lenses and explore ideas for adapting local teaching and assessment strategies

These discussions were framed and structured using methods from gameful design to create a shared language for critically evaluating and developing GAI/AI use cases that support and augment learning, teaching, and supervision. The intended audience broadly included academic staff, management, curriculum designers, instructors, students, and engineering education researchers, to foster rich multifaceted discussions on GAI in engineering education.

2 WORKSHOP DESIGN

The workshop design was grounded in principles from gameful design, utilizing and adapting *design lenses* (Deterding 2015) to the context of instructional design in engineering education. Design lenses combine a concise statement of a design principle with a set of focusing questions that helps the designer to adopt the mental perspective of the lens (Deterding 2015). The lenses utilized in the workshop were informed by insights derived from an ongoing scoping review into the integration of ChatGPT in active learning in STEM education. Each design lens begins with a description of a teaching and learning activity identified through the review, such as deliberate practice or feedback processes. These activities are first explained in general terms, without direct reference to GAI, followed by two broadly formulated focusing questions specifically addressing the potential application of GAI in relation to one's own teaching practices. Finally, the lenses provide specific examples from the literature demonstrating how these application areas can be operationalized in practice. The specific lenses used in the workshop were: "The Lens of Productive Practice", "The Lens of Interactive Scaffold", "The Lens of Targeted Feedback", "The Lens of Cognitive Offload", and "The Lens of Constructive Critique". An exemplary design lens is illustrated in Figure 1.

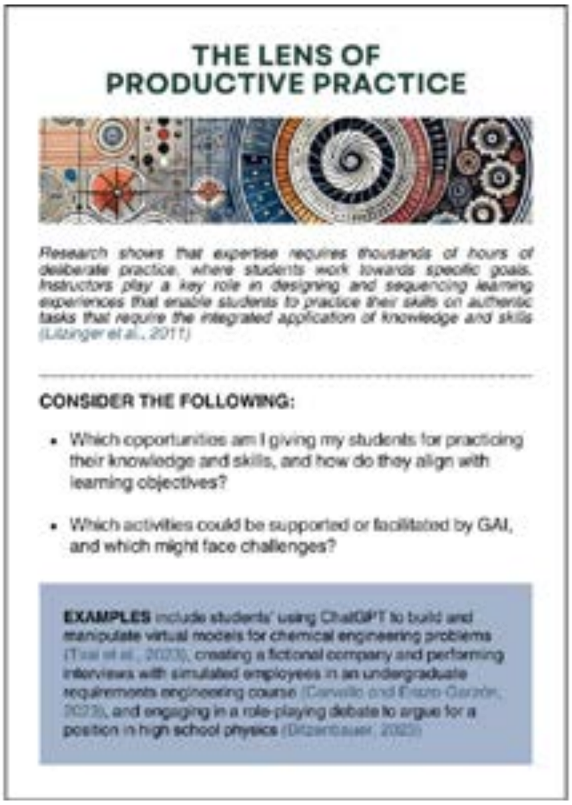

Figure 1. Exemplary design lens

The workshop followed a three-part structure (Table 1), integrating individual and collaborative brainstorms, discussions and case work to encourage active participation among the participants. At the core of these activities are the design lenses, which served not only as stimuli for ideation and perspective-taking, but also as a structuring element in conjunction with the think-pair-share model. First, participants were assigned a random design lens and asked to individually reflect and brainstorm ideas based on the perspective reflected in the lens, in relation to their local teaching practices (2.1). Second, participants formed small groups with others who had the same lens to share, exchange, and further develop each other's ideas (2.2.). Third, participants formed small groups with other participants who had different lenses to exchange highlights from the earlier steps (2.3).

After completing the think-pair-share activity, participants remained in their cross-lens groups and collaboratively worked on a case presented in plenary. The case scenario positioned each group as a team of instructors responsible for teaching and supervising an undergraduate engineering course with approximately 150 students. This course requires students to engage in collaborative, student-led project work. The task for each group was to brainstorm and develop teaching strategies that would help students effectively use GAI to enhance their collaborative project work. In addition, the groups were asked to propose strategies for guiding students in reflecting on and documenting their use of GAI throughout the project. While participants were given the option to draw on the design lenses introduced earlier in the workshop, doing so was not mandatory for this stage of the activity. Each group were asked to describe their ideas in a shared repository in Microsoft Forms.

Table 1. Workshop outline

Activity	Duration	Description
1. Introduction	10 minutes	Introduction to GAI, facilitators and agenda
2. Think-pair-share	30 minutes	2.1 Individual brainstorm with design lens 2.2 Same-lens brainstorm 2.3 Cross-lens exchange
3. Case work	20 minutes	Case work

3 RESULTS

The workshop attracted 38 participants, who formed 8 groups during the cross-lens exchange (2.3). The same groups collaborated together on the case work in order to ensure the representation of different perspectives from the previous rounds, albeit the design lenses were optional in this step. The ideas documented in the shared repository revolves around three main topics, which is elaborated in the remainder of the report.

3.1 GUIDANCE, INSPIRATION, AND FEEDBACK

Several groups addressed the importance of creating transparency and providing students with the necessary knowledge and tools to navigate guidelines and institutional policies regarding responsible GAI usage. One group emphasized the utility of a formal course policy that outlines the "*conditions and rules for using GAI in the assignment (e.g., disclosure rule and documentation)*". This group also highlighted the provision of appropriate use cases, specifically outlining three key examples: "*(a) using AI for breaking down the project in small steps (b) brainstorming initial solutions that are then critically revised and (c) obtaining targeted feedback on project productions*". These examples relate to the design lenses of targeted feedback and interactive scaffold, while an additional perspective is reflected in the brainstorming use case. Another group also stressed the importance of providing exemplary use cases but advocated for a more collaborative approach, suggesting that these use cases are co-created with students to foster a shared understanding of responsible GAI use. Additionally, multiple groups highlighted the importance of equipping students with the knowledge and skills to engage critically with GAI. Rather than adopting a passive reliance on AI-generated outputs, students should be trained to critically evaluate AI results, particularly regarding the accuracy and reliability of the sources, as articulated by one group:

"*emphasize fact checking and reliability of the sources provided by GAI*". Another group specifically linked the importance of critical engagement to the lenses of interactive scaffold and targeted feedback.

3.2 DOCUMENTATION

Different approaches to scaffold students in documenting their use of GAI was addressed by multiple groups. One group developed a use case based on short reflective videos, where students "*discuss their uses and uncertainty in a group and can get feedback from a lecturer about their use and reflection*". This idea is thus supplemented with student-teacher interaction, and according to the group, it encourages self-reflection and supports students in tracking their own journey of learning to use GAI. Another group proposed a similar idea where students would document their problem-solving process through short videos at each stage of their projects. These videos would require students to specifically reflect on how they used GAI in each step, how GAI contributed to their work, and what challenges they encountered. This idea is also supplemented by teacher-student interactions: "*During in-class sessions, we will discuss the unique and shared aspects of each project group's experience with the problem-solving process and the role of GAI therein*". Another group used the lens of cognitive offload as a source of inspiration for a use case, where students could use GAI to support their brainstorm processes and document their dialogue with GAI.

3.3 ASSESSMENT

In the context of assessment, one group proposed the use of summative assessment items that do not lend themselves to singular or definitive answers, thus reducing the risk of students offloading their cognitive efforts to GAI. Another group offered an alternative perspective on the role of GAI in assessment by suggesting that students could actively participate in the creation of exams by either 1) creating questions with ChatGPT, 2) creating their own LLM with a restricted data set that responds to questions, or 3) creating an exam using only their knowledge. The purpose of this approach is to help students critically examine the differences between AI-generated responses and their own understanding, ultimately fostering deeper reflection on the role and limitations of GAI.

4 SUMMARY

The discussions and ideas documented by each group present a wide range of inspiring perspectives on the integration of GAI in engineering education, both with and without the use of design lenses. These contributions reflect careful consideration of how GAI can be incorporated into teaching and learning environments in ways that promote responsible use, critical engagement, and reflective practice. The participants were also encouraged to test these ideas as well as design lenses in their local teaching environments and share the outcomes and experiences gathered – thus continuing the conversation initiated during the workshop.

ABSTRACT

This paper presents a comprehensive overview of the workshop 'Empowering Engineering Education: Tools and Strategies for International Accreditation,' held to support engineering educators in aligning with international accreditation standards. The workshop, organized in collaboration with the European Network for Accreditation of Engineering Education (ENAEE), aimed to enhance the capabilities of participants in areas such as curriculum enhancement, faculty development, student engagement, and industry collaboration. Through interactive discussions and practical tasks, the workshop provided insights into tools and strategies essential for meeting and exceeding accreditation benchmarks. The paper outlines the key learning objectives, engagement activities, and outcomes that contribute to the global standardization and quality assurance of engineering education programs.

[1] J C.Quadrado

1 INTRODUCTION

1.1 Primary Objective

The primary objective of this workshop is to strengthen the processes of international accreditation for engineering programs, with a special focus on developing a comprehensive registry of skilled educators. This is to be achieved through the implementation of targeted tools and strategies that foster quality assurance and enhance the accreditation landscape in engineering education. Such an endeavor aligns with the growing emphasis on establishing rigorous standards and ensuring the continuous improvement of engineering programs worldwide (Patil and Codner 2007).

1.2 Key Goals

The workshop aimed to achieve several key goals that are instrumental in elevating the standards of engineering education.

1.2.1 Development and Dissemination of Tools and Resources

One of the core goals was to create and share tools and resources that support quality assurance and international accreditation. These resources are designed to guide institutions in aligning with established accreditation frameworks, such as the EUR-ACE Framework Standards and Guidelines, which have been acknowledged for their efficacy in fostering high-quality engineering programs (ENAEE 2021).

1.2.2 Enhancement of Educator Capabilities

A critical aspect of this initiative involves enhancing the capabilities of engineering educators to not only meet but also exceed international accreditation standards. By focusing on professional development and capacity building, educators will be better equipped to deliver curricula that align with the dynamic requirements of the engineering profession, thereby ensuring that students are adequately prepared for the challenges of the global engineering landscape (Guberti et al. 2015).

1.2.3 Collaboration with ENAEE for Continuous Improvement

Another significant goal was to foster collaboration with the European Network for Accreditation of Engineering Education (ENAEE) to refine a framework for the ongoing improvement and adaptation of accreditation processes. This collaboration is essential in responding to emerging educational and technological trends, ensuring that accreditation practices remain current and relevant (ENAEE and IEA 2015).

1.3 Workshop Structure

The workshop was structured to offer a comprehensive and interactive learning experience, enabling participants to gain a deep understanding of the key aspects of international accreditation in engineering education.

1.3.1 Learning Objectives

Participants gained insights into the process of continuous framework improvement for accreditation, particularly in response to the dynamic and evolving landscape of educational trends. A focus was placed on understanding the latest tools and strategies essential for achieving and maintaining international accreditation across different levels of engineering programs (Augusti 2006). This aligns with the broader goal of ensuring that institutions can adapt their accreditation processes to remain effective in a rapidly changing environment.

1.3.2 Relevance and Attraction

The workshop addressed the critical need for adaptable and contemporary accreditation practices within the field of engineering education. Given the rapid advancements in technology and the growing demand for engineering professionals who possess globally recognized qualifications, this workshop served as a timely intervention to equip institutions with the necessary strategies for achieving international accreditation standards. As highlighted by Patil and Codner (2007), such initiatives are integral to ensuring that engineering programs remain relevant and capable of meeting the needs of an increasingly globalized workforce.

1.3.3 Engagement and Interaction

To maximize participant engagement, the workshop employed interactive, collaborative discussions and hands-on problem-solving activities that are closely aligned with the established learning outcomes. These activities were designed to foster a deep understanding of quality assurance principles and encourage participants to apply the concepts in real-world scenarios, ensuring that they are better prepared to implement accreditation processes within their respective institutions.

1.3.4 Significance

The significance of this workshop lies in its potential to shape the future of engineering education. By providing educators and institutions with the tools and strategies needed to not only meet but exceed current accreditation standards, the workshop contributed to the establishment of a culture of continuous improvement in engineering education.

This proactive approach ensures that engineering programs are well-positioned to adapt to future educational requirements and technological advancements, fostering the development of a globally competent engineering workforce (ENAEE 2021). Ultimately, this proposal aims to create a dynamic and influential platform within the SEFI network for sharing, developing, and implementing best practices in engineering education accreditation. This, in turn, contributes to the global standardization and enhancement of educational quality in the field of engineering.

2 INTEGRATION OF KEY CONCEPTS FROM THE WORKSHOP PRESENTATION

One of the critical themes discussed during the workshop presentation was the concept of 'Continuous Quality Improvement in Higher Education Institutions.' This slide emphasized the importance of strategic planning, outcome-based assessment, and involving all stakeholders to ensure that engineering programs are constantly striving for excellence. It aligns directly with ENAEE's approach to quality assurance, where ongoing evaluation and improvement are crucial to maintaining accreditation standards.

The workshop also addressed the 'European Education Frameworks for Engineers,' highlighting the European Standards and Guidelines (ESG) and the EUR-ACE Framework Standards. These frameworks serve as the foundation for establishing quality assurance in engineering education, ensuring that programs are structured around well-defined learning outcomes and competencies. This reinforces the collaboration with ENAEE, as it plays a pivotal role in maintaining the integrity of these frameworks.

Another key slide presented the 'Two Pillars of ENAEE Wisdom,' focusing on Quality Assurance and Programme Outcomes. The slide underscored that ENAEE's accreditation process involves assessing the processes and procedures within engineering programs, such as teaching methods, learning outcomes, and internal quality assurance mechanisms. This underscores the importance of ENAEE’s role in defining what constitutes a high-quality engineering education.

The 'EUR-ACE Accord' was introduced as a significant milestone in fostering mutual recognition of accreditation decisions across various authorized agencies. This accord facilitates the standardization of engineering education, allowing accredited programs to be recognized internationally, which greatly benefits mobility and employability of graduates. ENAEE's role in coordinating and authorizing agencies to award the EUR-ACE label is a key factor in the success of this initiative.

Lastly, the 'EUR-ACE® Database' was highlighted as a valuable resource containing information about accredited engineering programs across the globe. This database serves as a central repository, providing transparency and accountability for programs that have met rigorous accreditation standards. It exemplifies ENAEE's commitment to quality assurance and the promotion of high standards in engineering education.

3 WORKSHOP ACTIVITIES AND COLLABORATION WITH ENAEE

During the workshop, participants engaged in a practical scenario where they were tasked with evaluating and enhancing their institution's engineering curriculum to meet and exceed international accreditation standards. This involved addressing key areas such as Curriculum Enhancement, Faculty Development, Student Engagement, and Industry Collaboration, ensuring alignment with ENAEE's quality assurance framework. Through collaborative discussions, participants proposed actionable strategies for integrating advanced technological trends, incorporating sustainable development goals, and strengthening industry partnerships to maintain program relevance and excellence.

4 CONCLUSIONS AND IMPACT

The workshop successfully equipped participants with a deeper understanding of how to implement international accreditation standards within their engineering programs. Participants completed the workshop with a comprehensive understanding of effective strategies for international accreditation, enhanced by practical experiences gained through workshop activities. This includes an in-depth appreciation of quality assurance frameworks and their application in engineering education.

Collaboration with ENAEE facilitated the exchange of best practices, resulting in actionable frameworks for continuous curriculum improvement, faculty upskilling, and industry integration. These outcomes significantly contribute to establishing a global standard for engineering education and preparing institutions to adapt to evolving technological and educational trends.

ABSTRACT

This workshop, inspired by the Archimedean Oath, seeks to engage participants in critically reflecting on the responsibilities of engineers in society. Following the update of the content of the Oath to address contemporary challenges, the workshop aims at fostering ethical considerations among graduate students, educators, and industry professionals. Through a partially immersive experiences and thematic discussions, participants will explore various representations of the Oath and its implications for engineers who adopt it and more broadly, for the engineering practice. The workshop will provide a platform to discuss diverse perspectives, allowing attendees to understand the Oath's fundamental principles and its potential as a tool for ethical reflection. Emphasizing the importance of ethical decision-making in complex and rapidly changing environments, the proposed activities seek to use the Archimedean Oath as a tool to empower engineers to uphold principles of social responsibility and environmental stewardship, while acknowledging the need for a more scaffolded integration of ethics and sustainability throughout the engineering curriculum. By the end of this interactive workshop, participants will have gained insights into the significance of the Archimedean Oath, identified strategies for incorporating it into educational settings, and critically analysed the pertinence of the Oath as a reflection tool. The workshop will therefore provide a valuable opportunity for stakeholders to engage with the ethical dimensions of engineering and contribute to the development of practices fostering responsible engineering.

1 OUTLINE

1.1 Motivation and Learning outcomes:

Inspired by the Archimedean Oath, written at EPFL in 1990, and recently updated by a student-led effort, this workshop aims at leveraging the Oath as a tool to trigger reflection. Participants will explore multiple illustrations of the Oath and discuss the various strategies to foster active and meaningful engagement with the ideas expressed in the Oath, as opposed to oaths being passive pledges. We see the Oath as an instrument to prompt engineers to reflect on their calling to responsible engineers, and an opportunity to look back at what they have learned in their study programme through the lenses of ethics and sustainability.

To prompt critical and constructive considerations about the roles of engineers in our society, stakeholders from industry, heads of institutions, teachers and students are invited to participate in this partially immersive experience.

At the end of the workshop participants will:

1. Explain the Archimedean Oath to a larger and diverse audience, including its fundamental principles, intentions, and scope.
2. Be able to raise awareness about the multiple affordances of the Archimedean Oath as a tool to trigger ethical reflections on the role responsible engineers should have in our current and future society.

3. Be ready to answer if the Oath is an actionable practice by critically assessing it as a tool to make a curriculum fit for purpose. In doing so, participants should be able to identify the necessary ingredients to add, remove or transform the curriculum to integrate the principles of the Oath.

This workshop will be most useful for:

- Graduate students.
- Teachers interested in and/or teaching topics related to ethics, sustainability, and value-led education.
- University administrators in charge of university policies.
- Professionals who see the need for hiring engineers capable of taking ethical and sustainability challenges into account in their daily work.

1.2 Background and rationale

In the increasingly complex, interconnected and rapidly changing world, scientists, researchers, and engineers often face ethical dilemmas and moral complexities in their work within and outside academia (Shamoo et Resnik 2009). Additionally, because of the rapidly changing effects of climate change on the environment and our societies, engineers need to use their expertise to design rapidly evolving solutions (The Lemelson Foundation 2022).

Technical and engineering education institutions are increasingly focusing on nurturing students' critical thinking skills, particularly with regards to ethics and sustainability, confirming the relevance of the broader responsibilities of engineering students in addressing complex global challenges (Truslove et al. 2022; Lozano et al. 2013). For this reason, we expect students to commit to and, most importantly, reflect on the ethical consequences of their work.

In other fields, the coupling between ethical concerns and science has been perhaps more evident. In medicine, graduating doctors adopt the Hippocratic Oath. Composed over 2,400 years ago, and originally written for physicians, is the most ancient and well-known example of explicit integration of ethics in professional practice (Hulkower 2016). In ecology and environmental sciences, the publication of Rachel Carson's *Silent Spring* warned the public about the dangers of pesticides to society and eventually contributed to the beginning of the environmental movement (Shamoo et Resnik 2009). More recently, the growing complexity of information systems, urge software engineers to make an increasing number of decisions involving ethical components (Järvinen 2017).

Further practical examples of obligations from the engineering field are The Ritual of the calling of an Engineer in Canada, and the Order of the Engineer in the United States. Both involve an accreditation ceremony during which those who accept to comply with the obligation of the pledge receive a ring (The Ritual of the Calling of an Engineer 2024; Order of the Engineer 2024).

In 1990, inspired by the Hippocratic Oath, a group of four physics students from EPFL, gathered for the first time to write an oath for engineers: the Archimedean Oath. Their aim was to make an active contribution to the development of their institution and highlight their awareness of their responsibility to the positive development of the world. That year, the Oath was signed by approximately 40% of the students during their graduation ceremony before falling into disuse. Since then, the Oath has been adopted at the discretion of the faculty dean. Similarly to the Hippocratic Oath (Hulkower 2016), it has lost some of its relevance due to its outdated nature and therefore students do not easily identify with its principles. For this reason, a student association at EPFL updated the text, allowing students to better identify themselves with contemporary challenges.

The Archimedean Oath prioritizes the well-being of all and the preservation of the environment in professional practice (Figure 1). It emphasizes personal responsibility, ongoing improvement, and consideration of wider consequences on a larger scale. It cautions against military applications and commits to environmental and social preservation, equity, justice, transparent communication, and integrity.

While conceptually significant, the Archimedean Oath has not been extensively studied or discussed in academic literature compared to the more established ethical frameworks in science. We also acknowledge the limitations of an Oath requiring engineers to commit to ethical and sustainability principles for which they might not have been trained throughout their whole engineering curriculum. Nonetheless, we trust that the Archimedean Oath has the potential to trigger a reflection on ethical and sustainability aspects of the engineering profession, create a sense of belonging and empowerment, and increase accountability and responsibility in graduating engineers.

Today, I swear to the following engagements, and promise to strive to attain the ideal they represent:

- I will practice my profession with the good of all people in mind, respecting human rights* and environmental sanctity.
- I will take responsibility for my actions, having informed myself to the fullest extent, and will in no case discharge such responsibility on others.
- I will strive to perfect my professional abilities.
- In choosing and completing my projects, I will pay attention to their context and their consequences, particularly with respects to technical, economic, social, and ecological aspects, and will strive for the respect of the environment.
- I will be especially careful in regards to any military uses that my work could have.
- I will contribute to preserving the environmental and social integrity of our planet.
- I will contribute to the best of my abilities to the promotion of equity for all human beings, and will help construct a just society for all.
- I will rigorously and honestly transmit any information to carefully chosen persons, if such information represents a necessary knowledge or if holding it back puts anyone in danger. In the latter case, I will ensure that such information leads to concrete actions
- I will not let my personal or professional interests take precedence over what I deem to be just.
- I will, to the best of my ability, strive to encourage those who surround me, in both my personal and professional life, to follow the ideals of the present oath.
- I will practice my profession in a context of intellectual honesty, with conscience and with dignity.

I promise solemnly, freely, and on my honour.

* According to the UN Universal Declaration of Human Rights

Figure 1: Archimedean Oath (last updated 2023)

2 STRUCTURE OF THE WORKSHOP

2.1 Workshop plan

This workshop is part of a larger project that aims at providing higher education institutions with a tool, the Archimedean Oath, that prompts engineers to reflect on their responsibilities to society and nature during and upon the end of their studies.

Table 1: Workshop plan

Timing	Activity	Description
10'	Welcome and walk through world café	Plenary: All participants get to know the Oath and interact with its different illustrations. No official explanation. Individually: Participants are asked to indicate how they feel about implementing the Archimedean Oath.
5'	Introduction	Plenary: Facilitators introduce themselves and the functioning of the workshop.
15'	First round of discussion tables	Small groups: Participants engage in discussions from different standpoints (students, teachers, institutions, and industry employers). Discussion will be initiated by answering the question "wearing the student/teacher/head of the institution/employer hat, how would you experience/learn/adopt the Archimedean Oath?"
15'	Second round of discussion tables	Small groups: Participants have the possibility of changing the thematic table after 15min and choose to take a different perspective on the Oath. The prompt for discussion remains unchanged. Individually: Participants are asked again to indicate how they feel about implementing the Archimedean Oath by means of a "thermostat". They share with the group and discuss how it compares with the previous one.
10'	Presentation of each table discussion's outcome	Plenary: One representant per table exhibits the results of the group discussion.
5'	Conclusion, questions, and next steps	Plenary: Facilitators take questions and invite them to continue the reflections started during the workshop throughout the conference and beyond its end by, for example, adopting the Archimedean Oath in their institution as they deem relevant.

2.2 Outcomes

The main outcome of this workshop has been the increased adoption of the Archimedean Oath, and enhanced engagement with it (in education, as a reflection tool). To increase its relevance across contexts, we have collected suggestions on how to best adapt the Oath to diverse institutional, societal, and cultural contexts in which it could be potentially used. To facilitate immediate adoption, we have provided participants with the Archimedean Oath so that they continue the reflections in their institutions and raise awareness about the importance of this tool in engineers' responsible practices. Two institutions have already started implementing it.

Some of the salient points raised during the discussions highlighted the advantages and limitations of the tool and presented strategies to interact with it in different institutional and cultural contexts. Participants identified as critical issues the name of the Oath, its enforcement, how to leverage it to create a sense of belonging, and how to filter it across the curriculum. Fifteen participants expressed their interest in addressing these questions and have been invited to participate in the working group with the objective of operationalizing the Oath as a tool for reflection and accountability to responsible engineers.

ABSTRACT

Decarbonization is a major objective of the European Union (EU) to achieve carbon neutrality by 2050. As an example, for the transport sector, shipbuilders and engine manufacturers are exploring prototypes and designs for ships powered by alternative propulsion systems to fuel energy, like wind-assisted propulsion. Higher Education Institutions (HEIs), through their science and technology curricula, must now prepare the next generation of responsible engineers to support these ecological transitions.

To guide educational program leaders and curriculum designers, the active workshop presented here permits to codesign a pan-European Master level

[1] *S. Rouvrais*
siegfried.rouvrais@imt-atlantique.fr

semester on energy EU sovereignty and decarbonization. The context is a 5-month expedition in an imagined cruise ship, a nomadic university which provides accommodation for the students with learning and teaching workspaces. This low-carbon ship, as a floating Lab, is to travel between several European cities, to meet various academic, scientific and industrial communities during the itinerary.

This paper reviews the activities and phases of this exciting workshop, operated several times in 2024, e.g. during the SEFI 2024 conference at Swiss Federal Institute of Technology. In sub-groups, participants propose their itinerary on a given geographical map and sketch out an original joint curriculum with the aid of a canvas of nine components elaborated in a project funded by the European Commission. No prior knowledge or expertise in energy topics are needed, just openness to new ideas and creativity in collaborative curriculum design.

1 GENERAL CONTEXT

1.1 2030 Agenda for sustainable development and global risks

The context of the workshop is the challenges of climate change and sustainability, both of which are the subject of a broad consensus worldwide. According to the 2024 19th edition of the World Economic Forum (WEF, 2024), “Climate change encompasses the range of possible trajectories of global warming and consequences to Earth systems. […] Global warming pathways will still be influenced by the speed at which decarbonization takes place, and deployment of climate solutions.”

The WEF perception survey ranked by severity and the likely impacts of risks over a 10-year period. Among the 34 risks identified, the four first ranked are environmental risks: Extreme weather events, Critical change to Earth systems, Biodiversity loss and ecosystem collapse, and Natural resource shortages. Energy is a major subject as seen with the EU objective to reduce dependence on fossil fuels and its transition to renewable energies (e.g. wind solar power, overtaken gas for electricity production in the EU). Moreover, to better face future crisis and resilience, energy sovereignty is now a challenge, its ability to control, regulate, and manage its own energy resources and systems, its independency between the EU member states.

1.2 New skills of engineering students on decarbonization

The success of a decarbonization strategy requires coordinated action at all levels, in particular HEIs through their science and technology curricula when preparing the next generation of engineers. The inclusion of Environmental and Social Transformation (EST) throughout the student's curriculum enables to train future professionals capable of integrating these issues into their future careers. Engineering education must adopt a systems-based approach that incorporates both ecological principles and societal needs. An EST competency referential is to be infused into a curriculum, e.g. (i) systematically analyse the impact of human activities and industries on ecosystems and the climate, (ii) apply a historical and forward-looking approach favouring a critical stance in the face of major resource-energy-climate issues, (iii) embody individual responsibility to act collectively at international levels, and (iv) create value chains respectful of a sustainable future.

Some challenges remain: training future EU engineers, as future actors of change and transformation, students equipped with right skills for innovative energy large-scale projects, capable to facilitate effective inter-state cooperation. Future engineers in energy fields are to learn about the energetic equations of several countries, facing the challenges of the EU energy production and consumption. Several learning goals are thus to consider for a pan-European energy program, including an interdisciplinary approach with economic implications of energy independence, politics to explore energy policies and regulations, environmental Science for energy impacts, as well as social studies to analyze the social and cultural aspects of energy sovereignty. A future-oriented thinking to envision and research future energy scenarios is important also. Future graduate students could be a force in becoming European activists and ready players of pan-European energy transitions.

2 IMAGINE AN EXPEDITION LEARNING CURRICULUM

The workshop here provides an opportunity to exchange innovative perspectives between curriculum designers, on the theme of a joint European semester with strong international dimensions. No prior knowledge is presumed. The original context is an imagined cruise ship, equipped with learning and teaching workspaces, traveling to visit both universities and large industries. The workshop mission is given to subgroups of 3-5 participants.

Expedition learning is not new. Since 1912, each year, the 'La Jeanne' mission, as a final semester, marks the end of the training course for 160 engineering cadets at the French Naval Academy. With 155 days on a warship, the young engineers round the world, can cooperate with e.g. Australian, Indonesian and Singaporean armies, both at sea and on land.

The ship here is to be also a Lab. Recently in 2024, shipbuilders and engine manufacturers are exploring prototypes and designs for ships powered by more carbon-neutral systems, like wind-assisted propulsion and alternative propulsion systems to fuel energy. The International Windship association (2022) classifies wind propulsion technologies into categories including soft sails, hard sails, Flettner rotors, suction wings, kite sails, and turbines. Several large shipping companies plan such installations as part of their goal to achieve net-zero emissions. Workshop participants are given some characteristics of such a ship to host learners: 100 meters long, 3000 square meter sails, 40% fuel reduction, up to 200 cabins and a transit time of around 400 km per 24 hours.

2.1 Workshop phases in the 1-hour format

The workshop can be held in one hour only, it has been operated in three hours. After a very short context presentation of the workshop objectives and phases, two European energy maps are used as a context. With all their controversies, the first presents geographically, per country, most used energy production, the second energy source (cf. in Figure, phase on energy sovereignty). They are based on the BP statistical review of World Energy from 2024. This energy outlook considers the "major forces influencing global energy demand and supply flows, and the prospects for the energy transition out to 2050"[2].

For around 40 minutes, participants work together in subgroups. Each group elaborates on the broad lines of the final curriculum semester. Groups draw the itinerary (on a given A3 map) of the ship visiting at least 5 major universities and 5 companies around EU countries they select. Each city is to meet some EST goals, e.g. with links to strategic energy industrials activities, e.g. for decarbonization: wind power, nuclear power, geothermal or hydrogen energy. The Learning & Teaching courses can take place both during the travel at sea (ship having workspaces and invited professors and industrials on a leg) and during stopovers.

The itinerary prospection is most often done in parallel with the curriculum co-design, facilitated by a canvas with nine components (cf. Figure, phase curriculum co-design), defined in the context of a EU Erasmus+ project (Matthiasdottir et al. 2024). The canvas includes, from top-left to bottom-right: main goals and learning outcomes of the program, entry requirements, structure and contents of the program, teaching and learning methods, location of teaching and learning, interpersonal skills, assessment methods, language of instruction, and ethno- and sociographic aspects, including diversity and equity.

Fig. 1. Workshop activities and materials.

Some inputs are prefilled in the canvas, time depending and based on the profiles of participants and awareness of energy scopes. As examples, (i) areas of knowledge

[2] https://www.bp.com/en/global/corporate/energy-economics.html (consulted in September 2024).

and skills are suggested in the corresponding learning outcomes component, and (ii) broad lines of entry requirements are given. On need, 4 fully filled curriculum canvas are given for the previous semesters, somehow profiling the entry requirements, here the Building Energy Systems Engineering B.Sc. from Vilnius Tech, followed by three semesters respectively from: M.Sc. Sustainable from Reykjavik University, M.Sc. Sustainable Management Water & Energy from RWTH, or Management & Engineering of Environment & Energy from IMT Atlantique. The last M.Sc. semester on Energy Sovereignty is thus to be designed. The groups are not to fill all the component descriptions, they follow the structure to facilitate the design of their original curriculum and suggest highlights, time depending.

In the end each group displays its route and curriculum draft on the room wall. Filled Creative Commons materials are shared by email with the participants after. To close the session, in the short one hour version, remaining minutes are dedicated to group semi-structured exchange orally, before a more formal qualitative and quantitative questionnaire submitted online right after the workshop.

3 WORKSHOP ANALYSIS

The workshop has participant learning outcomes around curriculum design skills: collaborate with and learn from others, inspire others, ideate and exchange experiences, inter-connect programs, network with curriculum designers. A Likert-scale permits to verify if the participants skills were reinforced. Even though a hypothetic curriculum scenario, it has been analysed thanks to the online questionnaires and semi-directed discussions that participants of the workshop strongly appreciate the freedom that they could experience. The workshop strongly stimulates constructive and structured discussion between participants during design phases and collectively during the debriefing phase, and it "*encouraged me to think outside the box and view curriculum development in a slightly different way. The task was unusual in a good way* (verbatim)". But "*convincing academics to do things in a slightly different way than they are used to normally* (verbatim)" is seen as an obstacle for transfer in own institution context.

The workshop duration in 3 hours is more appropriate to go deeply in the canvas components, with subgroups of 3-5. At the SEFI 2024 conference, in one hour, 11 participants in 3 groups, from Australia, Czech Republic, Denmark, Ireland, and UK, actively engaged in this workshop, all phases were covered. Participants reported that "*It would have been great to have slightly longer, nevertheless, it was a fruitful hour, and we managed to get the task done and had a useful discussion. Very good session, I enjoyed it!* (verbatim)", and "*it was all right but I felt we could spend more time sharing our ideas and developments* (verbatim)".

Participants most often start from the learning outcomes component, which is the usual keystone in integrated curriculum design based on constructive alignment principles. One participant wrote "*learning outcomes, it was at the beginning, and it seemed the basis for the rest of the work* (verbatim)". For such, 4 areas of knowledge and 6 of skills and competencies are given now in the corresponding learning outcomes component of the canvas to fill. Also, the canvas has now one or two lines of description per component to answer that it "*could be helpful to add a sentence in each box with the questions to answer* (verbatim)".

Semi-directed discussion showed also that controversial skills are to be in the learning outcomes when on energy sovereignty, challenge-based learning is an adequate model, or student teams could be re-mixed on each stops of the itinerary. Semester structure with 30 ECTS prompts to a maybe large 14 weeks project as for a final thesis or internship model (Audunsson et al., 2022). Starting and ending locations can depend on the seasons (February in North or South) or on a EU region more advanced in renewable energies to favor transfer by students in other regions later.

"*It was entertaining experience* (verbatim)". Having engineering students in their last semester to travel throughout Europe to interact with universities and industries is an attractive, innovative, and exciting idea. The European Commission has proposed a blueprint for establishing a European degree, with the aim of facilitating deeper cooperation among HEIs across Europe (European University Association, 2024). In line with some SDGs and global risks, this workshop is significant in the context of educating responsible engineers and equip them with EST competencies. This context, here energy engineering, is interchangeable without modifying the workshop collaborative phases and design tools, e.g. IA, Industry 5.0 or other educational fields and sectors like STEM, business and economics, natural or social sciences, law, could be envisioned easily, could it be with rail train.

ACKNOWLEDGEMENTS

This workshop idea was elaborated by the authors through the DECART project, co-funded by the Erasmus+ programme of the EU (www.decartproject.eu, reference 22022-1-FR01-KA220-HED-000087657). Authors are fully grateful of other members of the project. The SEFI 2024 workshop participants from Atlantic Technology University, Czech Technical University, Monash University, Swiss Federal Institute of Technology, Technical University of Denmark, and University College London are thanked for their fruitful collaboration. This paper echoes the memory of Jean-Philippe Coupez, Study Director at IMT Atlantique suddenly passed away in 2024, with whom funny discussions were often engaged during coffee breaks on this hypothetical "Love Boat" engineering student trip.

***Keywords**: Process-level learning outcomes, Self-reflection, Growth mindset*

ABSTRACT

This workshop introduces a shift towards process-level outcomes in engineering education, focusing on equipping educators with the means to foster critical thinking, reflection, and a growth mindset among students. Central to the workshop is a hands-on approach where participants actively engage in redefining knowledge-related learning objectives from existing courses into process-oriented outcomes. Educators will start crafting a rubric for self-assessment that embodies these new learning outcomes and development steps, setting the stage for the design of the educational experience. This practical exercise not only enhances the applicability of the concepts but also ensures educators leave with actionable tools to implement a more engaged, reflective learning environment. By focusing on process in addition to outcomes and by incorporating active participation in rubric creation, the workshop

[1] *P.AM. Ruijten-Dodoiu*
p.a.m.ruijten@tue.nl

aligns with the latest educational research, promising impact on engineering education by introducing educators to new transformative ways of teaching.

1 Motivation and Learning Outcomes

This workshop was designed to activate and guide participants in redefining educational activities by describing learning outcomes on a process level—a methodology that reflects a significant shift in educational philosophy. The primary goal was to equip educators with the knowledge and tools necessary to transform traditional knowledge delivery into an exploratory, iterative process that enhances students' engagement and ability to tackle complex problems. By breaking down knowledge-based learning outcomes into distinct stages, educators were encouraged to foster an environment where learning is not just about absorbing information but actively stimulating critical thinking, reflection, and synthesis as key competencies of students.

Participants engaged in implementing process-oriented strategies (e.g., self-assessment, reflection) within the context of knowledge-based learning outcomes. They navigated and discussed the challenges that this approach presents in conventional educational settings. One strategy explored was having students self-reflect on their personal growth related to the course's learning outcomes. Studies show that self-assessment not only fosters motivation and engagement (Boud, 1991; McMillan & Hearn, 2008) but also raises academic performance (Brown & Harris, 2014). Self-assessment enhances students' learning processes by fostering self-monitoring habits that are crucial for effective self-regulation (Schmitz & Perels, 2011). Additionally, self-assessments are well-suited for measuring individual learning gains and gaining detailed insights into students' own perspectives and experiences (McGrath et al., 2015).

By the end of the workshop, educators were better prepared to design courses that not only facilitate a deeper engagement with the subject matter but also encourage students to reflect on their learning journey. This comprehensive approach promises to not only improve the reliability of assessments but also to inspire a more profound, intrinsic motivation among students towards their studies, laying the groundwork for a more effective and reflective learning environment.

2 Background and Rationale

The evolving landscape of education underscores the critical role of self-reflection in fostering growth mindsets and intrinsic motivation among learners. Inspired by findings in educational design research (Valencia et al., 2021), the workshop presented an assessment approach that shifts the focus from knowledge-based outcomes to process-based ones. This framework was centred on promoting self-awareness and facilitating the autonomous development of competencies (van der Vleuten et al., 2017), laying the groundwork for a reflective learning cycle that deeply engages students in their educational journey.

The workshop proved particularly relevant and attractive for educators and curriculum designers seeking to enhance learner engagement and motivation. No prior knowledge about process-based strategies was needed; the workshop began with a short presentation that set the scene for an inspiring discussion. By adopting a process-focused evaluation, participants implemented strategies that not only boost student engagement but also cultivate a growth mindset—a critical element in fostering intrinsic motivation to learn (Ng, 2018). This is essential for developing resilient, adaptable learners who are equipped to face the dynamic challenges of the modern world.

Participants found the workshop invaluable as it offered practical insights into integrating self-reflection and process-focused learning outcomes into their teaching practices. The focus on intrinsic motivation and the development of a growth mindset is especially pertinent in today's educational climate, where the ability to adapt and engage in lifelong learning is paramount (Ng, 2018; Schmitz & Perels, 2011). Educators left the workshop equipped with the tools and knowledge to transform their classrooms into environments that empower students, encouraging them to take ownership of their learning and preparing them for success in an ever-changing world.

3 ENGAGEMENT OF PARTICIPANTS

To ensure participants are fully engaged and able to practically apply the workshop's concepts, the program was structured around a hands-on, co-design approach to writing learning outcomes. Participants, who included educators, education designers, and professional development trainers, were encouraged to bring learning objectives from existing engineering courses to serve as the foundation for the workshop's activities. This direct application to their current teaching practices ensured the workshop's relevance and applicability. For participants without their own courses, a set of generic learning outcomes was provided to engage in the exercise.

As a central feature of the workshop, participants worked in diads on very different types of learning objectives, ranging from understanding and applying mathematical equations to redefining objectives that help educators reflect on and understand the impact of their own teaching or coaching styles. Throughout the workshop, participants focused on developing a rubric for self-assessment that incorporated both the newly defined process-level learning outcomes and distinct developmental stages. This collaborative exercise allowed participants to explore various ways to enhance students' ability to engage with, reflect on, and solve complex problems, ultimately fostering a deeper understanding of the shift from traditional, outcome-based assessments to process-oriented evaluations.

The workshop schedule was as follows:

- Introduction presentation: Presenting the main ideas of self-assessment and process-level learning outcomes, along with expected outcomes and a short creative thinking exercise (10 minutes).
- Individual exercise: Participants defined both a starting and ending level on one learning objective of their choice, indicating the level they think students have at the start and end of their course (5 minutes).
- Small group discussions: Participants discussed their ideas in small groups, refined descriptions of the levels, and picked one example for group discussion (10 minutes).
- Group sharing: Each group shared their learning objective, including intended start and end levels, with the rest of the participants. Coordinators clustered similar learning objectives together (10 minutes).
- Collective work: Participants collectively added levels to the learning objectives to reach a total of four levels on each of the learning objectives (10 minutes).
- Feasibility discussions: A group discussion covered the feasibility of the levels the participants proposed (10 minutes).
- Final insights and take-home messages: Coordinators shared final insights and take-home messages based on the discussions during the workshop (5 minutes).
- The interactive nature of the workshop, combined with the focus on practical application, ensured that participants not only grasped the theoretical underpinnings of process-level outcomes but also left with a tangible product—a beginning of a comprehensive rubric tailored to their specific course contexts. This active engagement strategy not only enhanced the learning experience for educators but also prepared them to implement a more reflective and effective learning environment for their students.

Additionally, the workshop provided a platform for meaningful professional exchanges, resulting in several participants initiating self-reflection cycles at their respective universities. As a further outcome, a chapter will be proposed to the SEFI Handbook on Transferable Competencies & Skills based on the workshop and the related conference presentation by the same authors.

4 RELEVANCE FOR ENGINEERING EDUCATION

This workshop stands at the forefront of a pivotal shift in engineering education, advocating for a transition from traditional, outcome-focused learning to a process-oriented approach that emphasizes the development of critical thinking, problem-solving skills, and self-reflection. Participants left the workshop equipped with strategies and tools to inspire a new generation of engineers by fostering a growth mindset and focusing on process-based learning objectives.

The take-home message of this workshop is clear: empowering engineering students through a reflective, process-based learning framework is essential for cultivating innovative thinkers and problem solvers who are prepared to meet the demands of the future. Several participants have already begun implementing self-reflection cycles within their courses. Moreover, the establishment of new professional contacts during the session is expected to lead to ongoing collaboration in implementing these strategies. Documenting these outcomes in a proposed SEFI Handbook chapter will further expand the workshop's impact by disseminating best practices and insights for advancing engineering education.

ABSTRACT

Addressing diversity and inclusion within engineering education is vital for nurturing responsible and innovative engineers capable of tackling societal and environmental challenges. This workshop was aimed at exploring inclusive classroom strategies through playing the game *All Inclusive.* Drawing from real-life teacher experiences, the game acts as a vehicle for thought, i.e. a conversation starter on how to utilize a diverse student cohort to increase learning potential. The workshop was structured to ensure interactive participation, with an emphasis on small group discussions and plenary sessions to foster collective insight into inclusivity strategies. By the end of the session, participants were expected to have gained a deeper understanding of diversity's potential as a resource, develop ideas for inclusive practices and take away a novel, game-based tool for application in their educational contexts.

1 INTRODUCTION

The push for increased diversity and inclusivity throughout the educational system is becoming increasingly recognized, not just as a moral imperative, but also as a practical necessity.

Efforts to enhance diversity and inclusivity within universities aim to create environments, where all students and faculty feel supported and valued, regardless of their backgrounds. This is concerned with ensuring equitable access to resources, fostering a sense of belonging, and promoting a culture that respects and celebrates diversity. Such environments are crucial for driving innovation, enhancing problem-solving, and preparing students for a global workforce. Unlocking the potential of diversity is particularly salient within the engineering education arena, where we aim to educate the responsible, innovative engineers of tomorrow. Engineers who will take social and environmental responsibility in developing and using technologies to solve problems, we do not even know are problems yet (Rattleff and Sass 2023).

This workshop introduced participants to a game designed with the purpose of exploring how teachers can create an inclusive classroom with a diverse student cohort. Rather than an instructional manual, the game should be seen as a vehicle for thought, i.e. a conversation starter on how to utilize a diverse student cohort to increase learning potential.

1.1 Motivation and Rationale for this workshop

> "*The reason I entered my course into the EuroTeQ course catalogue was that I could see how my course could really benefit from the diverse perspectives on how health care options are organised differently, even within seemingly homogenous European countries, but I ended up finding it really difficult to engage and motivate my online exchange students in the learning activities I set up…*"

EuroTeQ Teacher

The Technical University of Denmark (DTU) is part of the EuroTeQ Alliance, a strategic academic partnership between predominantly technical universities. In this context we have a shared course catalogue in which teachers from across the alliance can offer their course to students across the alliance. The courses are offered in a purely online or hybrid format, with home students participating in-person, and EuroTeQ students participating online. As educational developers, our role within this partnership has been to support the development of innovative course formats to be offered through this course catalogue. It is in this context that three primary drivers led us to develop this game:

1) Feedback from teachers

Diversity comes in many forms, and through our work with consulting and engaging with teachers at DTU, we have experienced that teachers and consultants often lack the tools to engage with the challenges and potentials that such diversity brings to the classroom. Whilst diversity expressed through gender, academic pre-requisites, learning preferences and neurodivergence are areas that most teachers in higher education encounter, the EuroTeQ course format offers a particular view into diversity as expressed through cultural and institutional differences and multimodal participation (e.g. synchronous online/physical participants).

2) DTU Learning Lab teaching philosophy to “Teach as you Preach” (Rattleff and Sass 2023)

Being responsible for the STEM higher education teacher training at DTU, we wanted to develop an icebreaker activity feeding into a deeper conversation about diversity in all its expressions in line with the feedback we receive from our teachers.

3) Sustainability

When visiting, and receiving visits, from partners, we often ended up putting together tote bags with pens, notepads, and various gadgets. We wanted to be able to provide a EuroTeQ relevant, engineering education oriented, and sustainable memorabilia.

We consequently set out to create a tool and conversation starter, that has the potential to contribute to our efforts in flipping diversity from being a challenge to being a resource for students, teachers, and universities alike.

1.2 Learning Outcomes

The learning outcome for this workshop was to examine how we as universities can release the potential of diversity.

Together we explored classroom diversity dilemmas and inclusive approaches.

- discussed initiatives at the universities that increase the diversity potential.
- outlined a roadmap towards inclusive practices.

Participants

- reflected on diversity from a teacher and student perspective.
- developed ideas for inclusive practices.
-

2 THEORETICAL FRAMEWORK

In the pursuit of inclusive teaching within STEM higher education, educators are tasked with developing a classroom environment that actively values and leverages the diversity of its students. Inclusion means that within an educational setting, learners feel that they are valued, supported and empowered to contribute actively and meaningfully (Ahmad 2019).

To achieve an inclusive atmosphere, teachers must integrate a variety of competences into their pedagogical toolkit, including social, communicational, cultural, and psychological skills. These competences are essential for addressing and overcoming the barriers to inclusion, such as bias and stereotyping, lack of representation, discrimination, systemic inequities, cultural insensitivity and inadequate support and mentorship. (Awang-Hasim et al. 2019, Ceo-Difrancesco et al. 2019, Engelbrecht et.al 2013, Kruse et al, 2018, Molbaek 2018, European Commision 2019)

To develop and establish inclusive practices in STEM higher education, we need to consider both the cultivation of inclusive values and skills and approach inclusion from the perspectives of institutions, teachers, and students.

Following this line of thought, this game consists of three primary segments through which the teacher is asked to reflect on different approaches to diversity and inclusivity in the STEM Higher Education classroom: Dilemmas, Competences and Characters.

2.1 Dilemmas

The 17 dilemmas selected for this game are based on real life dilemmas experienced by our teachers at DTU. They have been selected to represent the range of diversity that our teachers encounter, not only within EuroTeQ, but perhaps more visible in that context. As such there will be dilemmas related to diversity as expressed though cultural differences, learning preferences, neurodivergence, gender, academic pre-requisites, and participation forms, i.e. online, hybrid or physical.

2.2 Competences

Three factors played into the selection of the 17 competences included in this game.

The competences identified in the literature review, as referred to above, provided the first round of narrowing down the scope of potential competences. We then cross-referenced this list with the 21 competences identified through a survey with >300 industry partners in the EuroTeQ universities' ecosystem[2].

This exploration into the expected competencies of our students shifts the focus of inclusive teaching. It moves beyond merely creating an inclusive learning environment to addressing the question of which inclusive competencies will increase students' employability.

Finally, we selected 17 competences, that we identified as broad enough to allow individual interpretation for teachers across our alliance, academic disciplines, and individual differences.

2.3 Characters

The last part of *All Inclusive* invites a well-known character into the game, who people can attribute certain characteristics to. We were inspired by the third person perspective dialogue workshop introduced by Hermsen, Dommelen and Espinosa (2023) at the SEFI 2023 conference in TU Dublin. We activate Hermsen, Dommelen and Espinosa's proposed introduction of a third person perspective in unfolding behavioural insights and inviting reflection. In the context of our game: *All Inclusive* this is related to how different behavioural strategies and competencies will produce different outcomes in turning diversity to a resource in various educational settings.

3 Workshop Setup

The room was prepared with tables spread out to allow 4-5 participants at each table. Participants arrived and placed themselves accordingly. One game was prepared at each table.

[2] https://euroteq.eurotech-universities.eu/docuwiki/wp4/

3.1 All Inclusive, the game

The session commenced with the selection of a “game master” at each table. The participants were given five minutes to go over the rules of the game and then 15-20 minutes to play the game. The facilitators were available for questions and clarifications throughout the game.

The game design and rules are as follows:

Setup: Participants arrange the dilemma, competence, and character cards into three separate piles, face down. The gamemaster reveals the top card from the dilemma pile, then shuffle the competence cards and deal 3 to each player.

Dilemma Discussion: Gamemaster reads the dilemma card out loud. Players discuss the dilemma, acknowledging that players may interpret it differently.

Competence Reveal: Each player selects one competence card and discuss its’ relevance in addressing the dilemma.

Character Perspective 1: Gamemaster reveals a character card. Players discuss how the character might approach the dilemma.

Character Perspective 2: Gamemaster reveals another character card. Explore how this new character might approach the dilemma in a different way than the previous character.

Reflection and Takeaways: Each player shares their insights from the discussion, focusing on how they would engage with similar dilemmas in the future.

4 BUILDING A ROADMAP

The second part of the workshop commenced with a presentation of the rationale and motivation for creating the game and an overview of the theoretical underpinnings. We invited the participants to think-pair-share and explore the classroom diversity dilemmas and inclusive approaches that emerged during their playing of the game.

During facilitated small group discussion, we raised the perspective from the individual level to the institutional and debated initiatives that increase the diversity potential. In plenum we outlined a roadmap on inclusive practices and ideas at universities.

4.1 Workshop – insights and outcomes

The participants at the workshop ranged from PhD students, engineering teachers to teacher support staff. We experienced a small cohort that engaged with the game's dilemmas, skills, and characters, and contributed to operationalising inclusive practices in engineering education.

They saw relevance in own teacher (training) practice, and took games home, to continue the dialogues elsewhere.

4.2 Road Map

Fig.1 Compilation of ideas developed during the workshop

The road map was drawn up in a matrix, allowing participants to reflect on the student, teacher and organisational level, both in terms of practices (what do we already do) and ideas (what would we like to do). For the sake of creating an overview, we split up some post its to allow one point/post it, condensed others for clarity, and finally grouped the inputs into common categories (see fig. 1). The aggregated matrix showed many interesting trends, overlaps and discrepancies between what institutions do/want to do. The matrix invites a range of possibilities for analysis, for the purpose of this paper, we will limit ourselves to present the results, which show clear differences on responsibility and focus between the student, teacher and organisational level.

It was evident that the suggestions for practices and ideas related to the student were focussed on the expectations and potential for the individual to act.

The student perspective was primarily focused on communities, social events and entry barriers to these. There was a clear emphasis on students being respectful and developing openminded and inviting attitudes. On the other hand, there was a lack of focus on academic belonging and how students can contribute to/hinder processes of becoming legitimate members of the academic society.

This last part was, however, evident on the teacher level, where the focus was less on the teacher as an individual and more on the teaching context and the teaching practice itself.

On both a practice and an idea level, the focus on the teacher was related to the role as communicator and facilitator in developing a reflective practice based on knowing and understanding issues that hinders participation and reducing barriers to that. There was a clear focus on the teaching role as also mediating the students feeling of psychological safety to invite the students to engage and participate.

The tools to do so are facilitating open and anonymous communication channels, inviting and listening to feedback and selecting inclusive study materials.

Lastly, and as could be expected, the suggestions made for the organisation were on an overarching perspective as related to the structural conditions the organisation offers, and can offer, to provide an inclusive environment.

In this section it was particularly clear that what some organisations offer as practice are still predominantly ideas at other institutions. Overarching these there was a clear focus on the responsibility to create structural changes and conditions that support both students and teachers in developing a broad perspective on inclusive practices, including training opportunities, developing clear codes of conduct, and robust it-infrastructure. Other points made invited the organisations to acknowledge that real inclusive practices also involve implementing intentional strategies in hiring both academic and administrative staff as well as student uptake to help foster a more diverse range of role models.

5 SIGNIFICANCE TO ENGINEERING EDUCATION

Inclusion was a recurring theme throughout the SEFI conference. It is indeed a multifaceted concept. The roadmap we present here remains open to additional practices and ideas necessary for building inclusive learning environments. This and other workshops show that there is no single path to creating inclusive universities, and the journey is paved with dilemmas that require ongoing conversations.

1 MOTIVATION AND LEARNING OUTCOMES

1.1 Motivation

An effective and current Continuing Engineering Education (CEE) ecosystem is vital to support the millions of practising engineers globally. CEE is considered as education of an engineer, technologist or technician after their initial educational phase (Uhomoibhi & Ross 2019). However, previous work has identified (Gomez Puente et al. 2023) the need for a shared lexicon around practices in CEE to allow better knowledge sharing that would enable a faster and more effective diffusion and adoption of concepts.

A taxonomy offers such a shared lexicon is a "*hierarchical classification system that makes categorising or finding terms within text easier*" (Pack 2002) and one that involves a clear vocabulary. Previously there was no taxonomy aligned specifically to CEE, which led to a creation of an initial taxonomy for CEE (Caratozzolo et al. 2024) to align CEE concepts and their implementation. Methodologically, this initial taxonomy was developed from an inductive analysis of eight case studies (Gomez Puente 2023), then refined and combined with a scoping review of literature (Caratozzolo et al. 2024, 2025). Such a methodology aligns with an empirical (a posteriori approach) to taxonomy development (Bailey 1994) and allows sequential inductive and deductive consideration of the emerging terms and their structure. In line with the approach of Finelli et al (2015), then this taxonomy benefits from an iterative refinement, particularly from experts within the field, and this workshop is intended to contribute a further stage of refinement from a broader sample

The workshop reviewed this initial taxonomy with the SEFI CEE expert community to validate and to refine further.

1.2 Learning Outcomes

The workshop brought together a range of experts (from universities, and professional and accrediting bodies), to review and refine the taxonomy for CEE.

At the end of this workshop, participants had:

1. Contributed their perspectives on what terms are important when considering CEE;
2. Gained an understanding of the existing CEE taxonomy;
3. Supported the authors to evaluate the coverage and validity of the CEE taxonomy, based on participant's own experiences and perspectives;
4. Identified areas to enhance the CEE taxonomy and enabled an iterated version to be developed (will be completed after the workshop through further ongoing engagement).

2 BACKGROUND AND RATIONALE

Engineers have influenced society, communities and the economies for centuries, with this impact historically being seen as broadly positive. However, we are increasingly aware of the (unintended) consequences of engineering practice on society and the world, as we better understand local, national and international interconnectedness. In essence, engineers need to be able to deal with “wicked” problems and fully recognise the more holistic impact of their practice (from an ethical, inclusivity, sustainability, human-centred and community perspectives). Moreover, they need to ensure society benefits from an appropriate fusion of technology and people (aspirations, skills, and their communities), e.g., as per Industry 5.0 (Huang et al. 2022).

In addressing these challenges, we need to find educational and training approaches for engineers throughout their educational and practice preparation and working lives. Considering the number of practising engineers and scientists globally, e.g. seven to 25 million in USA (NSB 2019); 17.2 million in EU (Eurostats 2019), then the need for an effective ecosystem around Continuing Engineering Education (CEE) is vital for engineers, society and industry.

For this ecosystem, we need to facilitate faster exchange of approaches to respond to the rapidly-changing skills demands and ways to deliver this education and training.

The current CEE taxonomy (Caratozzolo et al, 2024) has a limitation of being based on a small sample of perspectives from university academics, along with a corresponding review of literature for terms.

This workshop, with the range of roles and backgrounds involved in CEE, allowed a review of the taxonomy to ensure it has broader validity and utility as a tool to enable sharing of practices and approaches.

3 WORKSHOP DESIGN

The workshop was attended by a range of experts – from academic institutions from different countries (Europe, North America, and Australia) and from Professional and Accreditation Bodies. The overall goal of the workshop was to engage the workshop participants to help refine the current version of the CEE Taxonomy, with the intention that it better reflects a range of stakeholders in CEE.

The 60-minute workshop was organised in three main parts:

1. Participants individually noted what terms and concepts around CEE were important to them, and in their context and then clustered these through small group work;
2. The current taxonomy was introduced;
3. Participants worked to add their terms to the existing taxonomy to identify overlap with existing concepts, as well as to highlight new ones.

4 WORKSHOP FINDINGS

4.1 Participants’ terms and clustering

There were two separate groups that noted down their own terms and then in group-work clustered these together. Figure 1 gives an example of the grouping by one of groups with a similar approach taken by the other group.

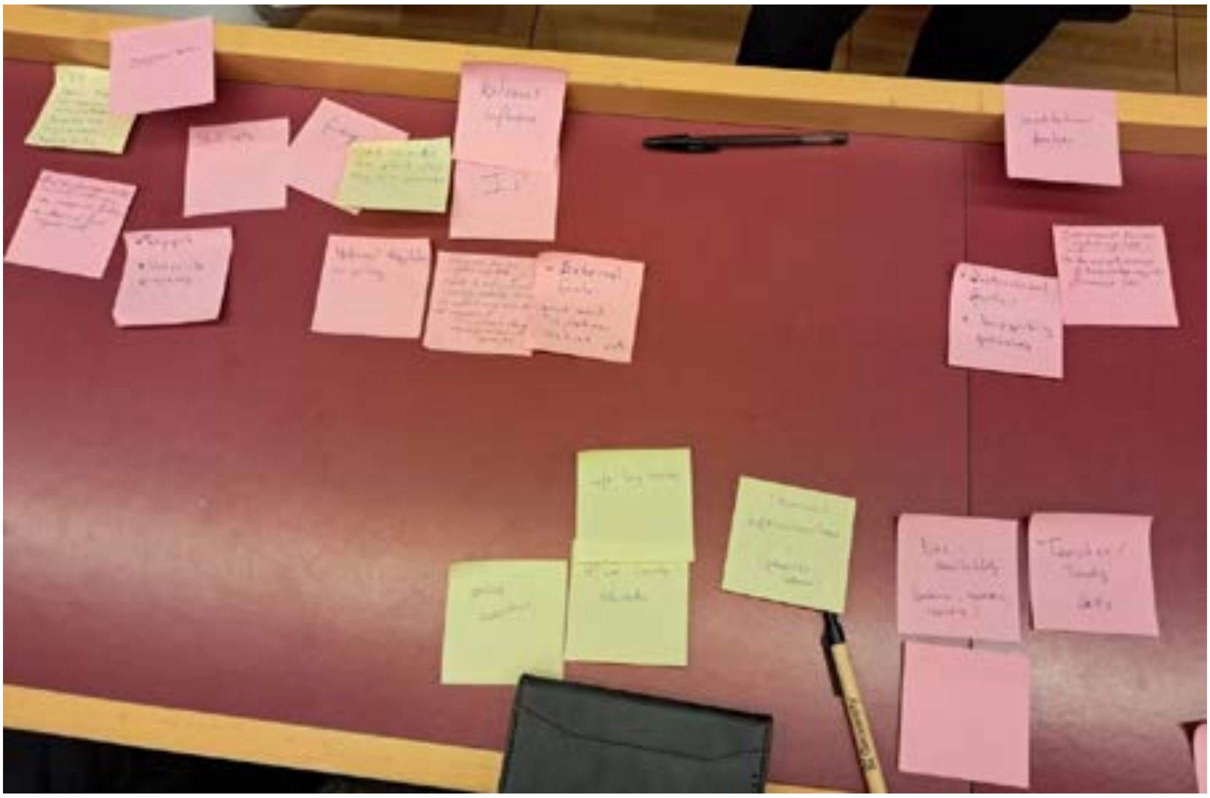

Figure 1: clustering of terms relevant to CEE from one of the groups.

Regarding the group discussions, group 1 output indicates institutional factors such as supporting policies, and recognizes institutional factors influencing permanent CEE. Some general points of attention are for instance, time availability; teachers' skills development; lifelong learning approaches; online/hybrid education, and alike. With regards to external factors, some elements mentioned are IP; government regulations, funding and budget possibilities; possibilities for the companies to pay for CEE offerings; national regulations within the EU; (pre-)defined set of skills; and, CEE organization differences, e.g. education vs. industry.

Group 2 indicated external factors, such as government policies, as well as institutional policies including how CEE was resourced, as well as recognising that CEE needed to be organised differently by universities. Importantly, they brought out the different types of learning, not just formal learning but also informal. Additionally, they detailed that the IT infrastructure for CEE is important. The important point of who teaches CEE, what motivates them to teach and remuneration for this work was detailed.

4.2 Update to the taxonomy

The current taxonomy was presented (version 2.1) (Caratazollo et al. 2025). In the open discussions around the taxonomy, then a number of enhancements were identified.

Key additional points that were not covered within the current taxonomy included:

- Intellectual Property;
- Consideration of IT/technical infrastructure to achieve this;
- Continuing Professional Development (CPD) as a term was missing and important;

- Digital badging (recognition of successfully engaging in and completing CEE courses);

Refinements of language suggested included:

- Referring to learning and not teaching (to reflect that CEE is not only taught, and that learning is the desired outcome);

Clarity was sought around the differences between hybrid and blended learning, and so links to recognised definitions will need to be included in the associated definitions for terms within the taxonomy.

Additionally, further terms/configurations were highlighted, such as

- "Diplomat" (course with greater than 106 hours of learning) and nano-credentials;
- Whether workplace learning should differentiate between 'Off-the-job' and 'on-the-job' training.

To validate the current taxonomy (version 2.1), then participants were asked to place their CEE terms (post-it notes) physically on a printed-out version of the taxonomy. This process saw strong overlay with terms; Figure 2 below gives a snap-shot of this overlay.

5 CONCLUSION AND NEXT STEPS

In conclusion, we perceived the acknowledgment of the participants to have a taxonomy that compiles a set of elements crucial to map CEE practices, organizational approaches and regulations. Furthermore, the taxonomy was recognized as a suitable method for further analysis of CEE practices.

Next steps will be to refine the taxonomy, and to engage further participants to ensure that the taxonomy is valid, useful and reflects international perspectives. Thereafter, clear definitions (lexicon) will be developed.

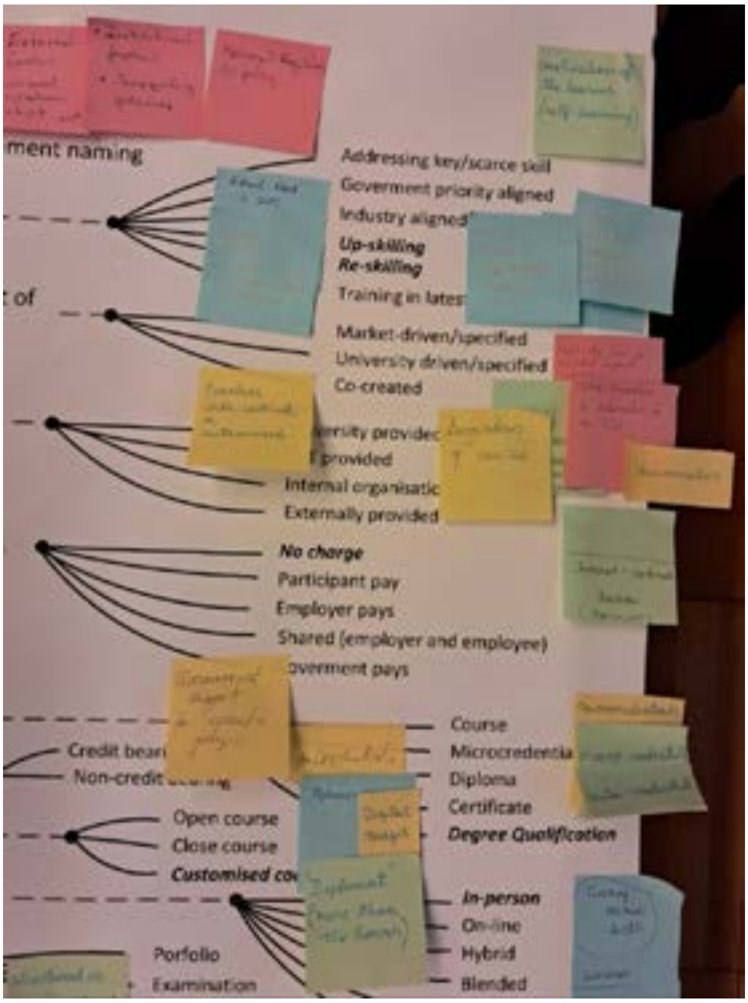

Figure 2: photo of overlay of participant Post-It notes on current taxonomy

ABSTRACT

Ensuring that teaching practice is fit for the 21st century is of pressing importance because it is the means by which we prepare all future practitioners and professionals to respond to challenges of unprecedented complexity whilst acting sustainably, ethically and equitably. However, change is complex, uncomfortable, frustrating but importantly, worth the investment - to teach better and to make positive and long-lasting improvements within our educational system. While many

[1] *J. Truslove*
jonathan.truslove@ewb-uk.org

excellent resources on sustainability education exist, there aren't many that explicitly guide engineering educators to integrate these into their teaching, or indeed that are intended to upskill engineering academics to be able to deliver this teaching. Recently, three projects have addressed this challenge are the Reimagined Degree Map by Engineers Without Borders UK (sponsored by the Royal Academy of Engineering), the Sustainability Toolkit by the UK's Engineering Professors' Council (sponsored by Siemens and the Royal Academy of Engineering), and the Engineering for One Planet Framework of essential sustainability learning outcomes and three companion teaching guides, co-created by hundreds of engineering education stakeholders (sponsored The Lemelson Foundation). Through reflection and a hands-on approach, this workshop will focus on what is needed to build the capacity and confidence of engineering educators to integrate global responsibility into their teaching, and make long-lasting change to their education practice.

1 OUTLINE OF THE WORKSHOP

1.1 Motivation and learning outcomes

In a Volatile, Uncertain, Complex and Ambiguous (VUCA) world (Rouvrais et al. 2018), navigating the complexities of educating the next generation is no easy feat, especially when educators can feel burdened with the pressures of accreditation, the need to embed transferable skills alongside technical curricula, the realities of space and resource constraints, not to mention their own scholarship and promotion agenda. Add these realities to the effects that Covid-19, AI, political conflict, and climate change have brought to education and the situation seems particularly stressful for those working in higher education. Indeed, reimagining engineering degrees is a huge task that involves questioning fundamental questions like 'what,' 'how' and 'why' we teach, and coupling that questioning with emerging understanding about how to engineer with deeper consideration of the broader impacts of engineering on people and the planet.

Educators must be supported in addressing these challenges, and this includes the support they require to build their own knowledge and skills in what are often new areas. Workshop presenters have worked with hundreds of engineering faculty, gathering feedback about their interests, priorities and needs for preparing students in today's context. This process has informed the co-creation of several teaching tools and curricular planning tools and has also revealed other gaps educators would like addressed. Among these are opportunities to develop their confidence, capabilities and commitment in teaching social and environmental sustainability/responsibility (in terms of both content and pedagogy), assessment of student learning, and assessment of their own teaching competence. With all this in mind, this workshop has three aims:

1. Engage with participants to critically reflect on the challenges, gaps and opportunities for preparing future engineers to be globally responsible and well-versed in sustainability.
2. Enable participants to identify what support is available to help them with "what" to teach but also on the "why" and "how" of educating globally responsible engineers. Presenters will showcase a suite of useful tools that participants can use (and the story of how they were co-created) to effectively

integrate social and environmental sustainability/responsibility into engineering education.
3. Identify what evolving teaching means for the roles educators play, and the competencies and capabilities required.

Following the workshop, participants will be able to:

1. Reflect on their own levels of competency in education for global responsibility, remaining needs or gaps, and identify resources that can support their development;
2. Access new tools, each containing multiple resources, (Reimagined Degree Map, Sustainability Toolkit, Engineering for One Planet) for supporting educators to develop their own knowledge and skills in order to integrate sustainability into engineering education and explain the relevance of these tools to their module/programme;
3. Consider the practical changes they can make to their institution's degrees, deeply consider what they need to invest in to support their team to adopt them and adapt to the changes.
4. Introduce these tools to their colleagues and advocate for their use.

1.2 Background and rationale

Society relies on engineering companies and professionals to build nearly everything around us and to address the urgent social and environmental challenges we face, including the transition to net zero and beyond. Yet coverage of sustainability, inclusion and ethics across engineering degrees remains insubstantial and inconsistent. Engineering education is key to shaping the next generation of engineers not only as technological experts but also as responsible citizens, equipping them to use their unique problem-solving capability to play a crucial role in stewarding humanity's future. Their impact is immense: in the UK alone, 250,000 engineers are expected to graduate from its universities before 2030, and these engineers will help shape the world we live in for at least 40-50 years (Engineers Without Borders UK, 2024).

The need for engineers to embrace global responsibility has long been recognised (Kamp, 2020) and now comes through as a central message of a new initiative called "Engineers 2030" catalysed by the Royal Academy of Engineering (2024). It emphasises the need for engineers to continuously develop their skills and approaches due to digitalisation, rapidly evolving complex technologies and the sustainability crisis. However, recent studies reveal a deeply concerning skills gap whether it is the capability to deliver on industry sustainability strategies (Institution of Engineering and Technology, 2021), decarbonisation and meeting net-zero targets, or a lack of exposure to the United Nations Sustainable Development Goals (SDGs) in higher education (Siemens, 2023), which has alarming repercussions for the workforce. Add to this the sense that "engineering degrees are not 'fit for purpose'", a sentiment that has emanated from both industry and professional bodies in recent years (see e.g. Flaig, 2022) and it is clear that change is urgently required in engineering higher education.

Decisions taken by people at every level of universities shape the content of a degree and the resultant student experience. Successful improvement in teaching often hinges on the emotional and cultural journey taken by an institution to create change (Goldberg and Somerville, 2023). Empowering people to act at all levels is key, as is developing shared direction and strong ambition across a department or faculty. This workshop is all about clarifying how to navigate making changes and equipping educators to act–from learning about new concepts and technologies, to discovering different pedagogies, to changing activities, projects and assessments, to making shifts at the strategic level that require adjusting outcomes and degree content.

During SEFI 2023, the Engineering Professors Council, Engineers Without Borders UK, and Engineering for One Planet shared three new resources through an introductory and reflective workshop - to catalyse educators who are enthusiastic about bringing sustainability into engineering education but lack the tools or practices they need to do so effectively. Read the report to learn more. https://www.sefi.be/2023/10/31/tools-for-sustainability-in-engineering-education/. Thanks to input from stakeholders in sessions like that one, the resources are now fully developed and shareable.

They are:

- The Reimagined Degree Map project undertaken by Engineers Without Borders UK (developed in collaboration with the Royal Academy of Engineering and endorsed by the Engineering Council, the Institution of Mechanical Engineers and the Institution of Materials, Minerals, and Mining);
- The Sustainability Toolkit project undertaken by the UK's Engineering Professors' Council (sponsored by Siemens and the Royal Academy of Engineering);
- The Engineering for One Planet (EOP) Framework of key social and environmental sustainability learning outcomes co-created by hundreds of engineering education stakeholders and used by hundreds of faculty (sponsored by The Lemelson Foundation), mapped to ABET and AHEP4 standards, and companion teaching guides.

Based on existing frameworks for teaching sustainability topics (e.g., Wiek et al., 2011) and extensive input from educators, students and practitioners in the engineering system, these tools simplify the process of curricular change. Some of these tools have already been vetted and used to modify or introduce hundreds of courses. Nevertheless, very little research and knowledge exists about the key competencies engineering educators need to develop in order to effectively teach and assess such content.

This workshop therefore will focus on what is needed to build the capacity of engineering educators to integrate global responsibility into their teaching. With participant reflection and input, we will aim to articulate key educator competencies needed to successfully teach and assess the skills of globally responsible and sustainability-minded future engineers. Through a hands-on approach, we will showcase how these available resources can be used to bolster what they know, what they can do, and how they can act to make the changes needed in engineering education.

2 STRUCTURE OF THE WORKSHOP

2.1 Audience

This session is relevant to engineering educators of all disciplines and backgrounds in higher education, as well as administrators and programme leaders responsible for accreditation and/or curriculum development.

2.2 Session Outline

This 60-minute interactive workshop will deepen attendees' understanding of *why* sustainability, ethics and inclusion must be embedded in engineering education, and *how* they could be implemented in their own educational contexts.

1. (15 minutes) First, the workshop will introduce the Knowledge, Skills, and Attitudes (KSA) framework that has been used to describe sustainability competence, such as in the European Commission's GreenComp Framework (2022). Through a reflective exercise and small group discussion, we will consider how these might be applied to engineering educators in the context of their work.
2. (10 minutes) Second, the participants will engage in a large-group discussion on how educator development of these KSAs might facilitate the ability for engineering programmes to change to meet 21st century needs. In this portion of the workshop, we will also identify barriers to both competency development and change-making within universities.
3. (30 minutes) Third, participants will have the opportunity to engage and explore interventions and practical steps they can make in their own institution, department, and modules with the support of the Reimagined Degree Map, Sustainability Toolkit, and Engineering for One Planet's "Tools for Teaching and Learning" resources.
4. (10 minutes) Finally, participants will be guided to reflect on existing good practice, where gaps remain in implementation and opportunities for collaborating through adopting these resources for driving change within engineering curricula.

3 RESULTS AND IMPACT

The intention was that the workshop initiated a broader conversation about the continuous professional development of educator competencies and commitment to teaching global responsibility. While some promising initial work has been done in this area (e.g. Corres et al., 2020; Kondur et al., 2020), clearly more needs to be done to support this, especially within engineering teaching.

One way to start this process is to ask educators to reflect on their own competencies. So, after introducing the Global Responsibility Competency Compass (a resource by Engineers Without Borders UK which articulates 12 essential competencies that align with the four principles of global responsibility: Responsible, Purposeful, Inclusive, and Regenerative. See www.ewb-uk.org/global-responsibility-competency-compass), we used Menti (polling software) to ask participants to rate themselves on the competencies they personally felt most and least confident about. Participants reported being most comfortable with two Skills competencies: Building

Resilience, and Facilitation, and with the Knowledge competency of Diversity, Equity, and Social Justice. They reported being least comfortable with the Mindset competency of Technology Stewardship and the Knowledge competency of Life-Centred Design.

We then used Padlet (collaboration software) to survey participants on which knowledge, skills, and mindsets engineering educators needed to have and develop to become confident and competent in teaching global responsible practice to students. In response to the question “What should engineering educators KNOW?”, replies included:

- How to effectively and seamlessly incorporate sustainability topics into their courses;
- That ‘correct’ solutions don’t exist;
- How students identify with engineering prior to enrolment;
- What the impact of introducing sustainability topics is to an engineering course;
- Emerging teaching methods;
- Broader non-technical content;
- How to incorporate aspects of humanities and social sciences into technical modules;
- How to develop reflection and awareness in ourselves and our students.

In response to the question “What should engineering educators be able to DO?”, replies included:

- Ask questions to generate clarity over time;
- Analyse and communicate data;
- Use statistical models and prognoses;
- Apply critical thinking;
- Address sustainability issues according to discipline.

In response to the question “How do engineering educators need to BE?”, replies included:

- Sensitized to social dynamics and complexity;
- Nimble and open to change;
- Curious, humble and open-minded.

Participants then worked in groups to explore the various resources available to them to support this competency development and educational practice: The Engineering for One Planet Framework, the Sustainability Toolkit, and the Reimagined Degree Map. 95% of attendees had not previously encountered these resources, and they left the session with ideas about how they could be used in their own teaching contexts.

Finally, because another outcome for the workshop was to discuss opportunities for establishing an international community of practice dedicated to using, promoting, and further developing these resources, we shared lessons learned to spur larger institutional change and asked participants to suggest ways that we could help each other. “Collaboration” was the theme of the responses, with “dialogue,” “share practices”, “communicate,” “listen,” and “cooperate” among the words used.

The more we understand why the world needs globally responsible engineers, why degrees need to evolve to meet this demand, why our pedagogies need to be active and contextual and therefore our assessments need to be authentic, the more likely we as educators are to feel connected to a culture of continuous improvement, and to feel motivated to make these changes within our departments or faculties. This leads not only to purposeful and future-proof engineering graduates, but also to educators with a stronger sense of meaning and purpose.

ABSTRACT

Teaching staff in engineering education often recognize the importance of Lifelong Learning (LLL) competencies but may feel ill-prepared to support students in developing these essential competencies. The TRAINengPDP project, an Erasmus+ initiative, addresses this challenge by focusing on preparing students for LLL through a Personal Development Process (PDP). This final workshop of the project aims to facilitate the co-creation of practical intervention designs. Drawing from a survey capturing perceptions of LLL competencies within engineering practice, alongside a scoping review of successful interventions in higher education, the workshop provides a comprehensive toolkit. This toolkit includes a training scheme for lecturers and the ENG-IST tool, designed to assist educators in selecting and implementing appropriate interventions, which can be tailored to their specific context. Participants engage in activities aimed at assessing the applicability of PDP interventions, designing interventions to develop specific LLL outcomes, and proposing assessments to evaluate achievement of these outcomes. Through active participation in the workshop, engineering educators can bridge the gap between recognizing the importance of LLL competencies and effectively integrating them into their teaching practice. By co-creating practical intervention designs, educators not only enhance their capacity to foster LLL competencies in students but also strengthen their own proficiency in lifelong learning practices. This workshop offers a valuable opportunity for engineering educators to acquire the tools and strategies needed to cultivate resilient, adaptable learners capable of thriving in a dynamic professional landscape. During the workshop 5 intervention designs were co-created.

1 MOTIVATION AND LEARNING OUTCOMES

Teaching staff often acknowledge the importance of Lifelong Learning (LLL) competencies but they do not necessarily feel adequately prepared to support students' personal development towards obtaining these important skills. TRAINengPDP is an Erasmus+ project which aims to prepare students for a life full of learning through a personal development process (PDP).

As part of the project a toolkit will be developed, including a training scheme for lecturers, the ENG-IST tool to support lecturers when selecting and implementing the appropriate intervention for their context, case studies of the project including the lessons learned from the pilots, and designs for possible interventions. In this final workshop of the TRAINengPDP project, the focus will be on co-creation of practical intervention designs. Participants of the workshop will be able to:

1. Assess the applicability of PDP interventions for achieving specific LLL learning outcomes.
2. Design a PDP intervention which enables development of specific LLL outcomes.
3. Propose an assessment to evaluate achievement of specific LLL learning outcomes.

By the end of the workshop participants will have a design draft of how to use a PDP intervention in their teaching practice.

2 BACKGROUND AND RATIONALE

Last year, the project team organized a survey to capture engineering students' and lecturers' perceptions about lifelong learning (LLL) competencies required in engineering practice (Beagon et al., 2023). Lifelong Learning (LLL) is considered to be a container concept, consisting of a variety of competencies. In their systematic review, Cruz et al. (2019) list the most frequently used criteria for lifelong learning competencies in engineering: self-reflection, willingness, motivation and curiosity to learn, self-monitoring, locating and scrutinizing information, and creating a learning plan. The results of the survey indicate that both students and lecturers consider all of the different competencies are either important or very important. Additionally, the results show that students and lecturers perceive that these lifelong learning competencies, are only taught to a limited extent and evaluated even less (Authors 2023). This in in line with another outcome of the project, namely the analysis of engineering study programmes to map out the extent to which LLL competencies are currently included. Findings indicated that there are very few learning outcomes which explicitly address LLL competencies.

The project team undertook a scoping review to identify which types of interventions have already been successfully implemented in higher education more generally (Beagon et al., 2022). We used these findings and the contextual aspects of how they were implemented to create the ENG-IST tool to be appropriate to the engineering classroom. The ENG-IST tool is a flowchart which identifies the most appropriate intervention for a particular context, and the educator's aims, based on different criteria and preconditions. In this workshop the participants will use the ENG-IST tool to develop an intervention design.

Participant engagement

0-10 minutes: Short introduction to the workshop, used concepts and definition, and introductory explanation of currently developed material.

10-20 minutes: Each group gets a learning outcome and individually choose two interventions that they believe they can use to achieve the learning outcome by using the ENG-IST tool. (LO1)

20-30 minutes: Use the intervention sheet to work out the intervention individually (LO1 & LO2)

30-35 minutes: Share with a pair (LO2)

35-45 minutes: Based on the selected teaching methods or tools, participants will individually work on including assessment and finalize their design. (LO3)

45-50 minutes: Share with group (LO2 & LO3)

50-60 minutes: Wrap-up by shortly, each group provides one example they worked out with some feedback and evaluate the usefulness of the intervention sheets. Each participant takes away an intervention design (LO1, LO2 & LO3).

Summary after the workshop & takeaway message

The different designs of the participants were collected and summarized after the workshop. The outputs will be included as a possible design in the toolkit. The five different designs are added in Appendix A.

Significance for engineering educators

Although teaching staff acknowledge the importance of LLL competencies, they are not considered the primary teaching goals (Nesterova, 2019) nor do they feel adequately prepared to support students in developing a LLL attitude nor the PDP itself. By engaging in this workshop, educators will gain access to a comprehensive toolkit developed through the TRAINengPDP, specifically designed to aid in the selection and implementation of PDP and LLL interventions. Through the co-creation of practical intervention designs, educators will not only enhance their ability to foster LLL competencies in their students but also strengthen their own proficiency in LLL.

This work was supported by the Erasmus+ program of the European Union (grant agreement 2021-1-BE02-KA220-HED-000023151) and is part of the TRAINeng-PDP project.

Appendix A

Case 1

a. Learning objective: The student can manage projects effectively, including the ability to plan, execute, and oversee tasks while considering resource constraints.

b. Context: Introductory course for new doctoral students, where students use the writing of their first journal article as a learning project. Hence the project has a tangible goal and the project is concrete and useful but not too big. Related to the project students need to define their timeline, end-users, milestones, roles and responsibilities, communication etc.

c. Teaching interventions to support the learning objective: Active student engagement. In class activities. Student-centered methods, Knowledge transfer sessions (e.g. upon tools, frameworks, external factors etc.), Mentoring (story-telling & peer support for intrinsic motivation), Reflective journal (peer evaluation, "advisory board" similar to real projects)

d. Assessment practices and criteria to support the learning objective: Criteria: ability to lead, reaching goals, own strategy building, ability to update plan, people committed, sticking to the budget. Practices: Feedback from project partners (co-authors. advisor/supervisor)

Case 2:

a. Learning objective: The student can solve problems, can respect deadlines, be flexible, and shows perseverance

b. Context / target group: 1st year undergraduate students

c. Teaching interventions to support the learning objective: E-portfolio

PDP-phase	Related activities
Identify	Students follow workshops in order to find out more about skills in professional context. Students set goals for themselves.
Prepare	Students prepare their portfolio. They make a plan for the semester, including deadlines.
Act	Updating the portfolio during semester. Collecting examples, reflecting on tasks and planning.
Monitor	Intermediate peer and/or mentor meetings to discuss progress and receive feedback.
Reflect	Conclude with a short reflection on the goals and the planning.

d. Assessment practices to support the learning objective:

Pass / Fail based on:

1. Participation in the workshop
2. Final portfolio (evaluation complemented by meeting with mentor

CASE 3:

Learning objective: The student can think critically and rationally about the role and responsibilities of engineers in their work organization and in society.

Context: not specified

Teaching interventions to support the learning objective**:** stimulate students to observe the world/news to see what engineers have been doing this day or week, and how that impacts the world

Assessment practices to support the learning objective**:** Reflective essay applying the approach of A.D. de Groot: Write about what you learned about the world: 1) What surprised you about the world; 2) what you learned about yourself; and 3) what surprised you about yourself - conveying an explicit and implicit message to continue to do this all your professional life

CASE 4:

Learning objective: The student can improve their professional competencies throughout the internship/module.

Context: International 1st year cohort of master's students; professional competencies understood to consist of e.g. self-regulation, reflective practice, value creation, working in teams, international/cultural skills, listening & communication, anticipatory thinking

Teaching interventions to support the learning objective: Reflective journal, in which students answer weekly following three questions

1. Most satisfying experience this week?
2. Most challenging experience this week?
3. What made you curious and want to learn more?

At the end of semester students deliver a copy of their journal including a final statement/conclusion

Assessment practices to support the learning objective: Journal contributes to the final assessment of students

CASE 5:

Learning objective: The student can integrate and apply knowledge from different engineering disciplines to address multidisciplinary challenges.

Context: Smart cities master, 1st year course on optimization methods, linear programming and network

Teaching interventions to support the learning objective:

PDP-phase	**Related activities**
Identify	1. Quick overview of the methods students need to comprehend (leaving space for others they may want to use and/or develop) 2. Look into city reality for problems that students find useful to solve
Prepare	Define the problem carefully with different steps to be accomplished (teacher support/input with materials to read/research)
Act	
Monitor & Reflect	Regular presentations evaluated by the teacher providing formative feedback about execution and constraints. Students incorporate the feedback to improve the tasks.

Assessment practices to support the learning objective: Students present the project with report and oral presentation

Conference Key Areas: *Teaching technical knowledge in and across engineering disciplines, Continuing education and life-long learning in engineering, Engineering skills, professional skills, and transversal skills, Curriculum development and emerging curriculum models in engineering and Building the capacity and strengthening the educational competences of engineering educators*
Keywords: *Evidence Informed (meta-)Cognitive Study Strategies*

ABSTRACT

The workshop "Teach Students How to Study Successfully" utilizes contemporary cognitive psychology to improve teaching effectiveness in engineering education. Addressing the gap in students' study skills, this workshop integrates evidence-based strategies to promote deep learning and motivation. Participants will explore historical and modern learning theories, challenge common learning myths, and apply Cognitive Load Theory to optimize teaching practices. Through hands-on exercises, interactive min-sessions, and group discussions, educators will experience and implement effective study strategies such as spaced repetition, retrieval practice, and self-explanation. The workshop aims to provide educators with tools to develop self-regulated learners, promote resilience, and create supportive learning environments.

Key takeaways include the importance of understanding cognitive, metacognitive, and behavioural aspects of learning, the necessity of practical application of these strategies, and the value of continuous reflection and adaptation of teaching methods. The workshop emphasizes collaboration among educators to share

insights and create a community of practice. By redesigning their educational practices based on workshop insights, participants will enhance their teaching methodologies, ultimately improving students' learning outcomes. This approach aligns with SEFI's mission to advance engineering education across Europe.

Participants will receive a comprehensive guide of effective study strategies, access to the original publication, and assignments to reflect and integrate these strategies into their teaching. The goal is to empower educators with confidence and tools to transform their methodologies, thus encouraging deeper learning and improved academic performance among students.

1 INTRODUCTION

Unfortunately students entering ours universities do not always have the right study skills. They might use study strategies that feel good, but are not that effective at all. One of my students* rephrased this by saying: “How to score straight A’s in the least amount of time!” Of course I don’t like the idea of only focusing on grades, neither did he: “No by really engaging and emerging yourself in learning, you do not only achieve deeper learning but your motivation increases as well!”.

This student was really touched by the workshop How to Study Successfully, a quite similar workshop I’ve given over 25 times now – So much so, that he dove into even more literature about studying and learning. That is something I hope to achieve with some participants as well.

I am pleased to present a workshop proposal entitled "Teach Students how to Study Successfully”. I aim to leveraging scientific insights for enhanced teaching efficacy. This workshop aims to illuminate the intersection of time-honored educational practices with the rich, empirical insights of contemporary cognitive psychology.

Drawing inspiration from luminaries such as Leonardo da Vinci and the foundational research of B.F. Skinner, the workshop will explore beyond traditional reward systems to the sophisticated processes that shape human cognition and learning. The workshop will dissect the nuances of visual stimuli in memory retention, challenging educators to reconsider the very fabric of teaching methodology.

Grounded in evidence-based strategies and historical pedagogy, including Guy Whipple's seminal "How to Study Effectively," the workshop aims to redefine the educational narrative. The workshop intends to foster an environment in which educators are equipped to cultivate self-directed learners and instil effective study habits as second nature.

This workshop will not only provide a platform for academic exchange but also serve as a catalyst for educational transformation within the engineering community. The workshop is based on the publication “Leer studenten studeren met succes” (Hoof 2021).

I look forward to the opportunity to contribute to SEFI's mission of enhancing engineering education across Europe.

Figure 1: The original publication Leer studenten studeren met succes. (Thomas More-hogeschool 2021)

Teach Students how to Study Successfully!

2 INTENDED LEARNING OUTCOMES

The publication "*Leer studenten studeren met succes*" (Hoof 2021) is very condensed and touches upon many cognitive, meta-cognitive and behavioral aspects of learning and studying:

1. **Understand the Evolution and Psychology of Learning:** Participants will be able to articulate how historical views on learning have evolved over time, including misconceptions and advancements in cognitive science.
2. **Comprehend Modern Learning Theories:** Participants will comprehend behaviorism and its implications for learning and recognize the shift towards cognitive theories that emphasize the roles of visual stimuli and memory processes.
3. **Define and Distinguish between Learning and Studying:** Participants will distinguish between innate learning processes and the deliberate practice of studying, understanding the cognitive activities that contribute to effective learning outside the classroom environment.
4. **Recognize and Challenge Learning Myths:** Participants will be able to identify and challenge common myths about learning, such as learning styles and multitasking, and understand their implications for teaching practices.
5. **Apply Cognitive Load Theory:** Participants will understand the principles of cognitive load theory and be able to apply this understanding to reduce unnecessary cognitive load in learners.
6. **Implement Metacognitive Strategies:** Participants will apply metacognitive strategies that help learners plan, monitor, and evaluate their understanding and progress.
7. **Develop and Encourage Effective Study Habits:** Participants will foster strong, motivating study habits based on evidence-based strategies, such as spaced repetition, retrieval practice, and self-explanation.
8. **Utilize Knowledge of the Brain and Memory:** Participants will gain knowledge of how the brain processes information and how memory works, applying this to enhance teaching and learning methodologies.
9. **Facilitate Self-Regulated Learning:** Participants will foster self-regulated learning in students, enabling them to become autonomous learners capable of setting goals, self-assessment, and adapting study approaches.
10. **Promote Metacognition in Learning:** Participants will understand the importance of metacognitive knowledge in their own learning process, using it to plan, monitor, and assess their study methods.
11. **Create a Supportive Learning Environment:** Participants will learn to construct a learning environment that minimizes distractions and maximizes engagement to aid the learning process.

12. **Develop Resilience and Adaptability in Learning:** Participants will be able to encourage students to embrace challenges and to develop resilience, understanding that struggle and difficulty are natural and necessary aspects of effective learning.

13. **Design Brain Friendly Learning Experiences:** Participants will be able, integrating all of the above, to redesign their educational practices into more effective and efficient active learning activities that use maximizes the students' brain potential.

3 RELEVANCE FOR AUDIENCE AND ENGINEERING EDUCATION IN GENERAL

Teaching lecturers about study strategies is essential for engineering education because of the unique challenges this field presents to students. Engineering courses often involve complex theoretical concepts in topics such as thermodynamics, or statics, or circuit analysis coupled with practical applications that require a deep understanding and retention of knowledge. Students frequently encounter multidisciplinary subjects that span mathematics, physics, materials science, and more, making the ability to integrate knowledge from various domains critical.

3.1 Common Study Problems Faced by Students:

1. **Conceptual Understanding:** Students often memorize procedures without understanding the underlying principles, leading to difficulties when problems require adaptive thinking.
2. **Integration of Disciplines:** Engineering programs often require knowledge of multiple disciplines, and students may struggle to see the connections between them.
3. **Time Management:** The volume and complexity of material can overwhelm students, making effective time management and study planning critical.
4. **Application of Theory to Practice:** Students may find it challenging to apply abstract theoretical knowledge to practical, hands-on problems.
5. **Overreliance on Rote Learning:** Engineering students may resort to rote learning, which is less effective for long-term retention and understanding, particularly in complex problem-solving.

Becoming aware of the problems students might have is often the first step to start helping them. Of course studying effectively is something they must do themselves, but implicitly and explicitly showing them what might work best for them, is something a lecturer can do.

3.2 Importance of Teaching Study Strategies to Lecturers:

1. **Enhanced Learning Outcomes:** When lecturers understand effective study strategies, they can design courses that promote better comprehension, retention, and application of complex engineering concepts.
2. **Cognitive Load Management:** Engineering students often face high cognitive loads due to the density of information. Lecturers can help manage

this by presenting information in ways that align with cognitive load theory, making learning more efficient.

3. **Problem-Solving Skills:** Engineering is a problem-solving discipline. Lecturers equipped with study strategies can teach students how to approach problems systematically, fostering critical thinking skills.
4. **Adaptability:** Engineering fields evolve rapidly with technology. Understanding study strategies enables lecturers to equip students with the skills to learn independently and stay updated with emerging trends.
5. **Practical Application:** Engineering requires the translation of theoretical knowledge into practical solutions. Lecturers can use study strategies to bridge this gap, emphasizing learning activities that simulate real-world engineering challenges.

Becoming aware of what impact lecturers can have on the learning and studying of students is often liberating, and feels enabling. Yes, you can make a difference! When faculty members join forces and align courses with the cognitive, meta-cognitive and behavioral principals in mind this impact will be even bigger. Students will increasingly get better at applying the study strategies.

They might surprise you with their deeper learning capabilities and the level of learning outcomes that become achievable.

4 ACTIVATING THE PARTICIPANTS

A workshop about Studying Effectively must contain effective study strategies. I'll do one better! Most of the study strategies will be experienced by the participants during the workshop! Therefor the workshop will be a mix of different activating activities in which participants will be asked to combine their own insights with the insights from the workshop to improve their teaching practice:

- **Interactive Sessions**: Participants will be actively encouraged to share insights from their experiences in teaching and learning. These sessions will be shaped by participant contributions, fostering a collaborative learning environment.
- **Hands-on Exercises**: Engaging, hands-on exercises will provide participants with a firsthand understanding of how the brain processes and retains information. Practical tasks will allow participants to experience effective study strategies and observe their impacts on learning.
- **Group Discussions**: Small discussion rounds will focus on challenging and bold statements about learning. These discussions are designed to provoke critical thinking and reassessment of existing beliefs and teaching practices.
- **Direct Instruction Bursts**: Concise, direct instruction sessions will cover theoretical foundations and current research on cognitive processes, metacognition, and the impact of learning behaviors. These bursts of learning will provide the scaffolding necessary for participants to understand the why behind the practices being discussed.
- **Educational Practice Assignments**: Assignments will prompt participants to reflect critically on their own teaching methods and consider

practical ways to modify them in favor of more effective study strategies. Participants will use the Wave model of blended learning to design the learning process of their students using the effective study strategies adjusted to their educational needs and setting.

A hand-out will facilitate rapidly shifting from one activity to another. An active learning space would best suit this workshop.

5 TAKE HOME MESSAGE

The take-home message of the workshop emphasizes the vital role that educators play in shaping not just the knowledge but also the learning skills of their students. It underlines the necessity of a strategic approach to teaching that goes beyond the dissemination of content to encourage life learning learning through evidence-based study strategies. The key points for participants to carry forward would include:

1. **Effective Study Strategies Matter:** A deep understanding of cognitive, metacognitive, and behavioral aspects of learning is crucial for enhancing the efficacy of study practices in engineering education.
2. **Practical Application is Key:** The theoretical knowledge of learning strategies gains true value when applied in practice. Participants are urged to actively incorporate these strategies into their teaching.
3. **Adaptation and Personalization:** While there is a shared foundation of effective strategies, the most impactful implementation will vary based on individual teaching styles and student needs.
4. **Continuous Reflection and Improvement:** The process of integrating these strategies requires ongoing reflection and willingness to adapt one's teaching practices for continual improvement.
5. **Collaboration and Sharing:** Educators are encouraged to share their experiences and insights with their peers, fostering a community of practice that supports mutual growth.

Participants will be provided with:

1. **A Comprehensive Document:** A detailed guide of effective study strategies will serve as a reference to support the integration of these methods into educational practices. This 10 pager describes the study strategies:
    - What is it?
    - Examples
    - When to use and for which goal
    - How to apply
    - Pitfalls
2. **Access to Original Research:** A link to the original publication (in Dutch for now but English might be there over the summer) will be made available for those who wish to delve deeper into the research behind the strategies discussed.
3. **Impactful Assignments:** The final assignment, which involves redesigning their educational practice, serves as an indirect measure of the workshop's impact and the participants' readiness to implement new strategies.
4. **Collective Reflection:** Reflecting together on the ease of incorporating these strategies into their teaching will culminate in a shared understanding of the most effective ways to implement these strategies in educational practice.

Figure 2: Cards with the study strategies. (Expertisecentrum Onderwijs en Leren (ExCEL) 2022)

The overarching goal is to leave educators with not only a toolkit of strategies but also the confidence to transform their teaching methodologies and, by extension, enhance their students' learning outcomes.

6 RESULTS

The "Teach Students How to Study Successfully" workshop yielded significant positive outcomes among the participating educators. The attendees were highly engaged throughout the sessions, actively contributing to discussions, exercises, and collaborative activities designed to immerse them in effective learning strategies.

Active Engagement and Participation

All participants demonstrated a high level of engagement during the workshop. They enthusiastically took part in interactive sessions and hands-on exercises that simulated cognitive processes related to learning and memory retention. This active participation fostered a collaborative environment where educators felt comfortable sharing insights and challenging existing beliefs about teaching and learning.

One participant encapsulated the collective sentiment by stating, "Of course we don't want students to reinvent the bicycle, but in order to understand the topic, students should reinvent the bicycle." This remark highlighted a shared recognition of the importance of encouraging students to actively engage with lesson content to deepen their understanding.

Enhanced Understanding of Cognitive Processes

Participants developed a robust understanding of how the brain functions in the context of learning. Through direct instruction bursts and practical exercises, they explored concepts such as cognitive load theory, metacognition, and the mechanics of memory. This enhanced understanding enabled them to critically assess and refine their teaching methodologies.

Integration of Effective Learning Strategies

A key outcome of the workshop was the successful integration of evidence-based learning strategies into participants' teaching practices. Utilizing the comprehensive guide provided, educators redesigned lesson plans for their courses, incorporating strategies such as:

- **Spaced Repetition:** Scheduling content reviews at increasing intervals to enhance long-term retention.
- **Retrieval Practice:** Encouraging students to recall information without prompts to strengthen memory pathways.
- **Self-Explanation:** Prompting students to explain concepts in their own words to reinforce understanding.

By applying these strategies, participants aimed to foster stronger, more effective study habits among their students.

Revamped Lesson Plans and Educational Practices

Participants employed the Wave model of blended learning to redesign their lesson plans, ensuring that the new approaches were tailored to their specific educational settings and student needs. The revamped plans featured:

- **Application of Cognitive Load Theory:** Adjustments were made to instructional materials to reduce extraneous cognitive load, making content more accessible without oversimplifying complex engineering concepts.
- **Metacognitive Skill Development:** Activities were incorporated to help students plan, monitor, and evaluate their own learning processes, promoting autonomy and self-regulated learning.
- **Supportive Learning Environments:** Changes were made to classroom setups and teaching approaches to minimize distractions and enhance student engagement.

Feedback and Reflection

Participants provided positive feedback on the workshop's impact, noting an increased confidence in their ability to apply cognitive and metacognitive strategies in their teaching. They appreciated the practical nature of the workshop and the immediate applicability of the strategies discussed. As one participant stated: “You have teached as you preached (.. about effective learning strategies).”

Educators also engaged in collective reflection on the ease and challenges of incorporating these strategies into their teaching practices. This reflection facilitated a shared understanding of best practices and potential pitfalls, reinforcing the workshop's collaborative spirit.

Impact on Teaching Methodologies

As an indirect measure of the workshop's effectiveness, the participants' readiness to implement new strategies was evident in their redesigned lesson plans and commitment to applying what they learned. The immediate integration of effective study strategies into their courses suggests a meaningful transformation in teaching methodologies that is likely to enhance student learning outcomes.

1 MOTIVATION AND LEARNING OUTCOMES

In an increasingly technology-driven and complex world, STEM jobs are crucial for fostering innovation with a focus on social and environmental responsibility. However, the engineering sector is currently facing a shortage of qualified professionals. Therefore, it is crucial to adequately prepare young individuals for careers in engineering to ensure a sustainable future. To address the lack of skilled professionals, education plays a vital role in developing relevant skills that drive innovative and creative solutions (Cropley 2015; Felder 1988). Beyond intellectual capabilities, research highlights the impact of self-efficacy – the belief in one's ability to surmount challenges – on students' motivation, interest, and success in both academic and vocational pursuits. Evidence suggests (Wimmer 2023) that individuals with a strong sense of their own competence tend to be more resilient in completing tasks and solving problems. Within STEM disciplines, creativity is widely acknowledged as a fundamental element in addressing modern demographic, technological, and societal challenges. Consequently, creativity is an essential attribute for aspiring engineers and a key determinant for career success.

---

[1] *A.-K. Wimmer*
anna.wimmer@soziologie.uni-muenchen.de

In Germany, there is a significant underrepresentation of women in STEM fields, especially in engineering. Gender stereotypes and conflicts act as barriers that discourage women from pursuing careers in these fields (Jeanrenaud and Wimmer 2023).

Incorporating creative methods into teaching offers a potential avenue to reverse this trend by making STEM subjects more appealing to female students. This strategy allows for unbiased discovery of their skills and competences, by actively breaking down stereotypes. Engaging with STEM topics through inventive and enjoyable methods fosters a personal curiosity towards these subjects, altering the perception of them as merely theoretical and uninteresting. Interactive, hands-on activities, problem-solving tasks, and inquiry-driven learning engage learners' intuitive, sensory, and playful thinking, nurturing their creativity and encouraging discovery and experimentation. Therefore, integrating creative elements into STEM education can inspire students to cultivate a personal connection and a genuine interest in these fields. Evidence indicates that incorporating creativity-promoting elements in engineering education can enhance students' confidence, intrinsic motivation and engagement in this field through the experience of self-efficacy (Henriksen 2014, 2014; Conradty and Franz X. Bogner 2018; Bedewy and Lavicza 2023). Ultimately, fostering creativity in engineering students can facilitate their integration into the workforce and equip future engineers with an essential interdisciplinary skill, crucial for solving complex challenges (Nordstrom and Korpelainen 2011) in a technologically advanced, multifaceted and changing world (Ciolacu et al. 2023; Qadir 2023).

Hence, the workshop aims to explore and elaborate different perspectives on creativity. Subsequently, we will consider how these concepts can be integrated into teaching methods and curricula for engineering education and research in the future, anticipating the future direction of engineering education.

Therefore, this workshop aims to explore strategies that can stimulate creativity and how these can be applied in engineering education. Firstly, to direct education towards a more diverse and inclusive engineering workforce (Abra 1994; Landes, Steiner, and Utz 2022). Secondly, by exploring how creative methods in education can encourage engineering graduates by experiencing their emerging competence to create innovative solutions that are also socially and environmentally conscious. Through this exploration, participants share their experiences and best practices within engineering disciplines. The workshop offers a practical experience in applying a creative teaching method, so the participants will be equipped with knowledge and a practical experience for cultivating creativity within engineering disciplines as well as a networking opportunity.

2 BACKGROUND AND RATIONALE

2.1 Why Creativity is Important for Engineering Education

In our technology-driven and sustainability-focused world, engineers need to be creative thinkers. Creativity is a key role for successful engineering and is fundamental to problem-solving (Felder 1988). It involves thinking in an analytical, critical and creative way incorporating multidisciplinary knowledge (Kirillov, Leontyeva, and Moiseenko 2015). Furthermore, in response to the challenges posed by the pandemic and the disruptions of Industry 4.0, engineering and higher education institutions must undergo a paradigm shift. This requires a greater emphasis on innovation and collaboration, with a focus on prioritising skills development and effectively integrating technology (Ciolacu et al. 2023). The importance of fostering creativity in engineering education is highlighted by its vital role in today's professional environment. Curiosity and creativity are essential for academic success and practical problem-solving, as they promote personal development and increase student engagement. Maintaining a well-rounded learning experience is important, as educators are central to cultivating these essential skills that prepare students for future challenges and opportunities (Pusca and Northwood 2018). Creativity promoting elements can contribute educating individuals who are capable of innovating rather than simply duplicating. This will enable them to respond effectively to the dynamic demands of our permanent changing world (Kirillov, Leontyeva, and Moiseenko 2015).

However, it is curious that despite the potential benefits there is not yet a stronger link between creativity and engineering education, resulting in a lack of emphasis on creativity in engineering education (Stouffer and Russell 2004). There is therefore a need to address the integration of creativity into engineering curricula (Cropley 2015 ; Qadir 2023).

2.2 Teaching Creativity for Engineers

Recognising the central role of creativity in problem-solving, it is crucial to integrate it into engineering curricula. As a result, various teaching tools, methodologies and learning environments as well as didactics have been developed and widely discussed in the field of engineering education. (e. g. Badran 2007; Tiza et al. 2023; Cropley 2015) Like Nordstrom and Korpelainen (2011) have highlighted, unconventional teaching tools in science education are fostering not only the learning process, but also creativity and problem-solving.

As one example, we have successfully been deploying association exercises (Santamarina 2003) in engineering education for more than seven years, especially for business engineering master students at Technical University of Munich, not only to highlight the importance of creativity for innovation, but also to provide means of fostering individual and organisational creativity by providing conducive environments.

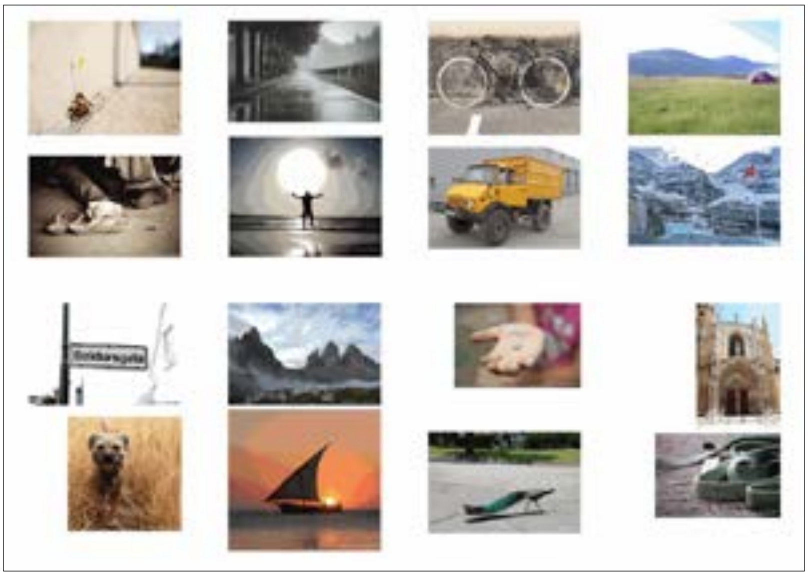

Fig. 1. Some examples used in the exercise “forced<>fit”.

Figure 1 shows some examples of images used in this type of exercise. They were collected from the online photographic platform Flickr[2] in 2024 and are all licensed under Creative Commons license (CC). Their respective authors are marked within the pictures by their Flickr handles.

The exercise called “forced<>fit” was particularly designed to help overcome mental blocks and system standards as well as to stimulate creativity. The exercise consists of mumbling groups (Waldherr et al. 2021) who are given a photograph printed in full colour on a sheet of paper. The first task is to freely collect as many associative strings as possible for the chosen picture, similar to Santamarina (2003), and then discuss it with one to two participants for a short amount of time. Afterwards, their results and insights are shared with the class. The exercise has proven to be easily applicable and yet powerful enough to help participants with problem-solving tasks and to experience the benefits of networking with knowledgeable individuals in our experimental setting by fostering creativity.

3 Workshop Design

The workshop’s target audience consisted of educators, researchers, and engineering students attending the annual SEFI conference 2024 in Lausanne, Switzerland. It was divided into three phases: onboarding and activation (1), creative co-creation of creativity (2) and summarising the results (3). These are illustrated in figure 2 hereafter. Within the timeframe of 60 minutes, the project-based group work (Melguizo-Garín et al. 2022) took place and longed to produce valuable results on the workshop’s topic.

[2] https://www.flickr.com/ [22 03 2024]

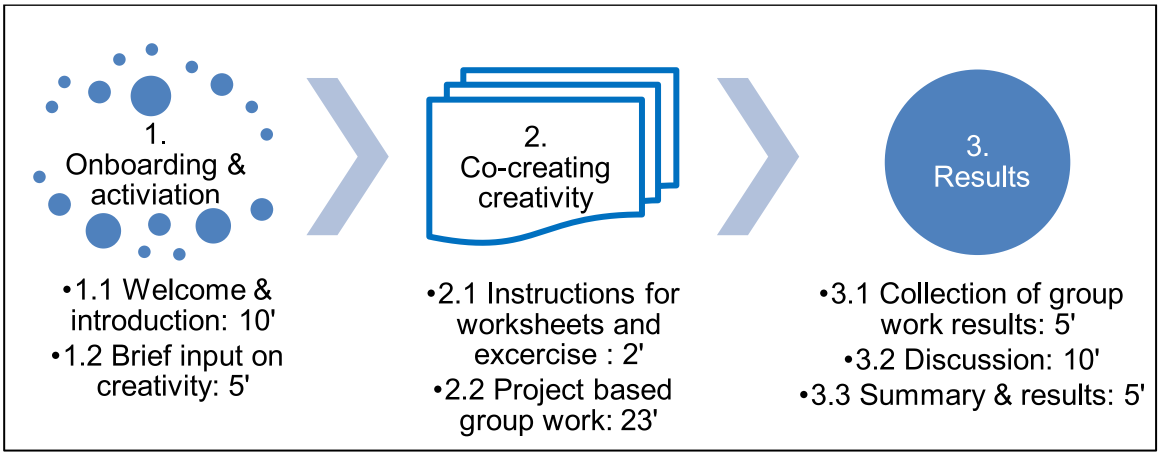

Fig. 2. Workshop Design in Three Phases

While the first phase (Onboarding & activation) was dominated by the starting phase, the short introductions of the workshop attendees was skipped due to the large number of attendees (25) (1.1, Welcome & introduction). Therefore, the framework of the workshop, its goals and working modes were briefly presented to set up the following process. A brisk introduction to the topic of creativity was given by the trainers (1.2) to have had everyone on the same page. The initial phase lasted approximately ten minutes. It was crucial to establish a productive and welcoming atmosphere for the workshop and to ensure a similar level of knowledge among participants.

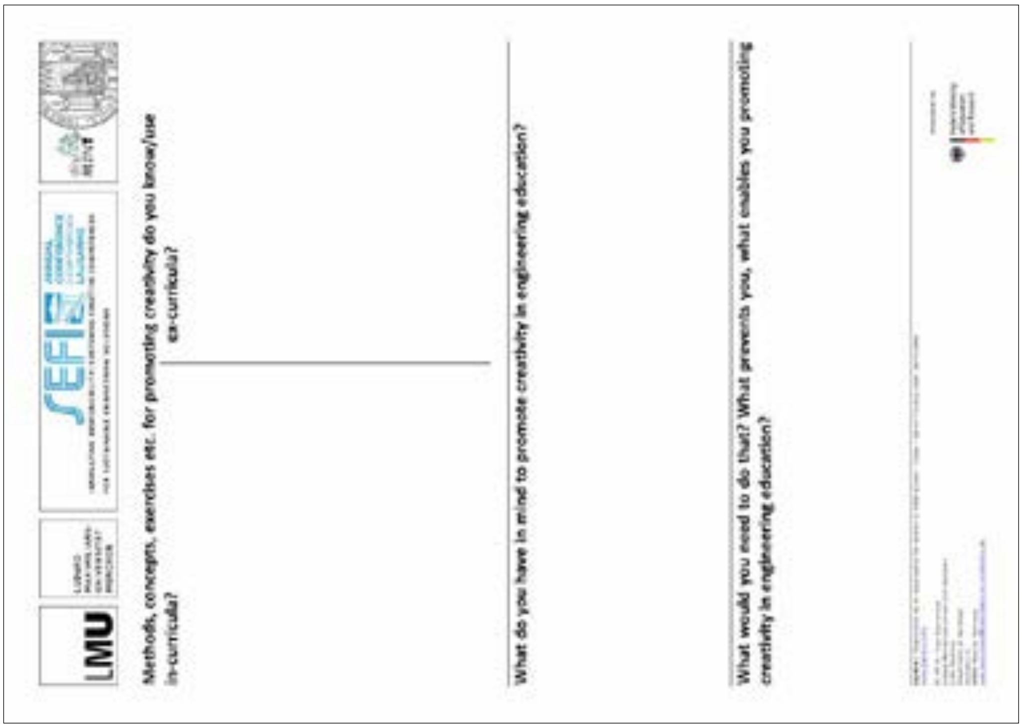

Fig. 3. Worksheet

The second and main phase of the workshop consisted of work in small groups of three to four people, dynamically allocated depending on the number of participants. If attendance had been particularly low, the workshop might also have been conducted with one larger group only. However, these groups were tasked with discussing and exchanging their perspectives from their corresponding background on creativity in engineering education and the profession. The worksheet (figure 3) was prepared to foster and steer this project-based group work as well as to document their efforts at the same time. The group work was introduced by using an exercise to foster creative thinking, such as the example “forced<>fit” shown above. This phase was taking place for about 25 minutes.

In the third phase, which lasted for 20 minutes and focused on the exchange of creativity concepts and teaching methods, respectively, the findings of each small group were collected and summarised in front of the entire workshop audience. Each group willing to do so briefly presented their specific findings (3.1), which then were collectively discussed by the larger workshop group (3.2). This discussion was moderated and documented by the workshop trainers. Finally, a summary of the findings was briefly presented for further discussion (3.3). To conclude the workshop, the results were summarised and put up for discussion (3.3). These results are hereby published in the revised workshop paper that is the final workshop report.

4 RESULTS

The workshop aimed to provide a platform to discuss creativity in engineering and engineering education from a theoretical as well as practical perspective. This helped to develop new methods and strategies to promote creativity in teaching practices within engineering programmes, thereby enhancing students' ability to think creatively and innovatively.

Some workshop participants seemed to struggle with the ambiguity of creativity, as the trainers avoided giving a clear definition, while others embraced the approach of leaving room for interpretation and henceforth allowing them to reflect more freely on creativity in the context of engineering education. The presentation of the “forced<>fit” exercise was deemed quite successful by the trainers and the audience, even though one participant questioned its link to creativity, suggesting that it might help more with concentration instead. However, research has shown that letting your mind wander and engage with other unrelated tasks, as the exercise demands, can be a crucial source of inspiration and may enhance creative problem-solving (Baird et al. 2012) by promoting divergent thinking, which is also true in natural sciences (Gable et al. 2019).

Hence, the implementation of the exercise was successful overall in the workshop. The project-based group work after that was perceived as very fruitful and insightful by the participants and trainers alike. However, more time to systematise findings and group sharing would have been beneficial. A methodology such as the World Café (Celments et al. 2024) could be helpful if the workshop had fewer time constraints.

The main findings from 16 worksheets volunteerly handed to the trainers revealed manifold approaches to teaching within engineering sub-disciplines, highlighting the impact of curricular constraints. As engineering education might leave little room nor time for extra-curricular content, despite its proven importance (Fakhretdinova et al. 2021), methods to promote creativity tend to align with and enhance existing learning goals already implemented in the curriculum, such as challenge-based learning, prototyping or design thinking. Essential methods sought include fostering self-efficacy and team collaboration. However, the main factors hindering these approaches are time constraints, lack of open-mindedness and difficulties in assessing creativity, despite some existing research in this area (Halpern 2012).

The workshop aimed to provide valuable insights into and exchange on the conceptual framework of creativity in engineering education and its impact on STEM fields, using the example of engineering, which was achieved. In addition, the workshop aimed to engage collaboration and knowledge sharing among educators and researchers, which also took place. The goal was to gain a deeper understanding of how creativity is perceived within STEM disciplines, here, especially engineering, and its implications for educational practices and career paths. The results thereafter help researchers deepen their understanding of engineers' education and career choices (Jeanrenaud and Wimmer 2023).

5 ACKNOWLEDGEMENTS

The project in which this workshop is embedded was funded by the German Federal Ministry of Education and Research (BMBF) under the funding code 01FP22M01. The responsibility for the content of this publication lies with the authors. The ongoing research project is fully funded under the programme “STEM Action Plan”, Field of Action 3 "Opportunities for girls and women in STEM", “Strategies for enforcing equal opportunities for women in education and research (STEM)” and the thematic focus "Increasing the proportion of women in the STEM research and innovation process: Strengthening self-efficacy, initiative and creativity" (MissionMINT – Women shaping the Future). The project is funded from October 2022 until September 2025.

Conference Key Areas: *Diversity, equity and inclusion in our universities and in our teaching; Building the capacity and strengthening the educational competences of engineering educators.*
Keywords: *sustainable communities; diversity, equity & inclusion; inclusive communities; inclusive conferences*

ABSTRACT

Our mission of educating responsible engineers requires a diverse and inclusive community where sustainability is a shared commitment. This workshop engaged

[1] *J. de Lima*
joelyn.delima@epfl.ch

participants in considering what it means to be a sustainable community and how this interacts with Sustainable Development Goals related to addressing inequity of access and experience. Specifically, we considered the barriers that people face to both being a part of the SEFI community and participating in SEFI events, and the potential impacts of these barriers on the sustainability of the community, and thus the future of engineering education. Based on a 2023 SEFI@Work event and survey data collected from SEFI members, this workshop engaged participants in reviewing initiatives, identifying priorities, and establishing recommendations for inclusion at SEFI events. We encouraged people from across the SEFI community, both those that see their concerns reflected in current inclusion activities and those who do not, to attend this workshop.

1 BACKGROUND & RATIONALE

To ensure a socially and environmentally sustainable future, it is imperative that our educational institutions focus on educating responsible engineers. However, developing such professionals requires the work of a community - dedicated engineering educators who leverage curricula and pedagogical strategies intentionally crafted by engineering education researchers. This approach underscores the importance of responsibility not only among the engineers but also within the ranks of educators and researchers who guide their development. Initiatives to make engineering education more inclusive must include both pedagogical aspects (de Lima, Isaac, and Kovacs 2024; 2023; Isaac, Kotluk, and Tormey 2023) and academic aspects (Dixon 2024; Chugh and Joseph 2024). By establishing a community where sustainability is a shared commitment across all these groups, we can more effectively address the challenges of today and pave the way for a resilient tomorrow.

Sustainability as a value also extends to the community, i.e. the SEFI community. What, therefore, does it mean to be a sustainable community? Going back to the 17 Sustainable Development Goals, we see that addressing inequity of access and experience is an integral part of the sustainable development agenda. The SDGs explicitly address inclusivity and equitability in educational experiences (goal 4), equal experiences across genders (goal 5), reducing inequities based on geographical locations (goal 10), and promoting inclusive and accountable institutions (goal 16) (United Nations [UN] 2015). Additionally, “Sustainability” along with “Inclusivity” and “Supporting and respecting diversity, equality and different cultures”, are three of the core SEFI values (SEFI, n.d.). This therefore requires us to consider the barriers that people might face to both being a part of the SEFI community and participating in SEFI events, and the potential impacts of these barriers on the sustainability of the community.

Making the SEFI community more inclusive, and therefore more sustainable, will have multiple desirable effects for both the community in particular, but also for engineering education in general. Increasing coherence with our professed values of sustainability and inclusion will allow us to widen our community and further enrich the education we are providing our engineering students. Integrating diverse perspectives and expertise, that might have been traditionally excluded and ignored, will ensure that our students are better equipped to build sustainable solutions and societies (Lucena and Schneider 2008; The United Nations Educational, Scientific and Cultural Organization [UNESCO] 2021). Additionally, this will allow formerly excluded community members to get access to the resources and recognition they deserve so as to improve engineering education across the globe.

An important aspect of building the SEFI community is participation in SEFI events such as SEFI conferences. Attending such events is beneficial both for community building but also for individual career development (de Leon and McQuillin 2020; Oester et al. 2017). Multiple studies have however shown that access to these events is not equitable (Biggs, Hawley, and Biernat 2018; Débarre, Rode, and Ugelvig 2018; King et al. 2018; Rushworth et al. 2021; Shishkova et al. 2017). As a community it is therefore critical that we identify and address these barriers to ensure that the knowledge we produce and the policies we implement are inclusive and representative of diverse voices (Abernethy et al. 2020). Involved in this work is the identification of potential barriers and subsequently defining key steps towards mitigating issues which run counter to social justice and equity.

2 MOTIVATION & WORKSHOP OBJECTIVES

This workshop built upon a previous SEFI@Work event (SEFI 2023), as well as data from a survey based on barriers to submitting and participating in SEFI conferences. It was intended to facilitate further conversation about what we can do individually and collectively to ensure sustainability in terms of evolution and renewal of the SEFI community and the resultant discourse. Although several initiatives have been introduced for the first time at SEFI 2024, work is required for them to become integral, regular parts of the annual conference, as well as other SEFI activities. We used the workshop to increase visibility and support and help refine future initiatives.

This workshop welcomed all members of the SEFI community, especially those who are interested in fostering a sustainable SEFI community, focusing on making it more inclusive, equitable, and welcoming of a diversity of members.

During this workshop, participants:

- Exchanged perspectives and reviewed survey data from the SEFI community on barriers they encountered to participating.
- Proposed strategies for mitigating and reducing barriers to participating in the SEFI community, including initiatives at SEFI 2024.
- Drafted a proposal of inclusion measures for future SEFI events (what is essential? What is nice to have?)

3 OUTCOMES OF THE WORKSHOP

This workshop engaged participants in constructive discussions about how SEFI could be more inclusive. Data from a survey completed by SEFI members between December 2023 and January 2024 was presented to support collaborative discussion. Participants were divided into two groups with each considering either barriers to feeling included in the SEFI community or barriers to participating in the SEFI conference (Table 1). Having shared the barriers identified with the wider group, each group suggested possible actions which could be implemented to address these barriers. Finally, participants were each given the opportunity to vote for 3 votes for initiatives that should definitely be implemented, and 3 votes for ‘nice to have’ initiatives. The proposed initiatives and results of the voting are presented in Table 2.

Table 1: List of barriers to ‘participating in SEFI events’ and ‘Feeling part of the SEFI community’, as identified by workshop participants.

Barriers to participating in SEFI events (e.g. conference, SIG events)	**Barriers to feeling part of the SEFI community**
High registration fees (lack of institutional membership and need to pay for individual membership)	Do not look like the rest of the community
Timing / schedule of the conference	Tensions between “engineering” and “education”
Lack of knowledge about SEFI	Different scientific traditions and having to apologise for identity (“I'm not an engineer but…”)
Being new the community	Perceived lack of confidence and competence in unfamiliar research methods and quality aspects.
Lack of knowledge about how Special Interest Groups (SIGs) work	Perceived status hierarchy between practitioners and researchers which also results in ambiguity and misalignment in relevant audiences for work.
Language (non-native English speakers)	Not knowing anyone else at the conference
Lack of knowledge about the sessions / scope and thus the value of attending	Lack of community outside the SEFI conference (during the year)
Childcare commitments	
Health issues	

Table 2: Actions proposed by workshop participants to mitigate some of the barriers listed in Table 1, along with the frequency of votes accorded to each initiative.

No.	**Initiatives that …**	**Should implemented at**	**Would be nice to**

		SEFI 2025 + future events	implement if possible
1	Asking for participants to provide keywords that reflect their teaching and research interests during registration. These keywords can then be added to the badges / app and will help people make connections based on shared or new interests.	5	2
2	Code of conduct with consequences	5	2
3	Prepare an informative welcome video “SEFI for new members” which introduces the aims and workings of SEFI including SIGs	5	1
4	Set strategic goal to hold SEFI conference in less expensive location in 4 years -> start now to identify potential locations and build capacity	4	2
5	Do more activities between annual conferences to build community and connections	3	3
6	Create “Faces of SEFI” profiles of community members throughout the year to highlight diversity of the community	2	6
7	Initiate research activities focused on uncovering the hidden curriculum at SEFI (research)	2	4
8	Reduce costs by co-hosting between an institution in less expensive city and an institution with a strong team and/or organising experience	2	1
9	Produce a SEFI glossary - what is a SIG, who ‘can be a member’ and how to get involved	1	2
10	Introduce more semi-structured/’icebreaker’ activities (like bingo activity during the newcomers’ lunch) to help build connections	1	2

11	Recommend SIG chairs start their meetings with an introduction to the SIG activities (avoiding jargon)	1	
12	Hold non-SIG SEFI community events		2
13	Creation of a ‘diagnostic online quiz that helps people identify with which SIG their interests are aligned and how to get involved		

Additional items that were not included in the voting activity

- Communicate being mindful that newcomers are in the room
- Promote benefits of SEFI for different target groups (value proposition)
- Different ways of working with engineering education (working across the differences)
- Provide a searchable database for people

From Table 2 it is clear that initiatives 1-3 were the most popular and are all considered to involve relatively low commitment. We would therefore suggest that these be the focus of efforts within the short term. In the case of initiative 2, “**Code of conduct with consequences**”, there was discussion around what would constitute a suitable and appropriate consequence and how this would be enforced, something which would involve discussion with the SEFI Board. Initiative 3 “**Informative welcome video**” (and initiative 9, “**SEFI glossary**”) would involve prior work into understanding the types of content that would be useful to newcomers but are relatively low commitment with potential for significant benefits.

Although popular, initiative 4 “**less expensive location**” (and initiative 8 “**co-hosting the conference**”) involve the support of the SEFI Board at a strategic level and may be more suitable as considerations in the long term. Initiative 5 “**activities between annual conferences**” (which received 6 votes in total) involves understanding the types of events that would be helpful in community building as well as higher levels of commitment, for example support from the wider SEFI community such as SIGs. This initiative should thus be investigated further but should not be considered as the primary area of focus.

Initiative 6 “**Faces of SEFI**” involves relatively low, but regular levels of commitment and, given the total votes (6), it is worth investigating the possible routes to achieving this. Initiative 7 “**uncovering the hidden curriculum at SEFI**” involves high levels of commitment and given the relatively low number of votes, may be considered at some point in future. Initiatives 10 “**more semi-structured activities**” and 12 “**non-SIG SEFI community events**” are fairly low commitment and may be pursued, assuming the availability of willing volunteers. Initiative 11 “**start SIG meetings with an introduction to the SIG activities**” is low commitment and therefore, despite the low number of votes, is worth pursuing. Finally, initiative 13 “**diagnostic online quiz**” received no votes, perhaps because of its aspirational nature.

4 CONCLUSION

The output from the group activity and feedback of participants was used to identify barriers that people might face to both participating in SEFI events and feeling a part of the SEFI community. Together, we also generated recommendations for future SEFI events and conferences to improve inclusion. Participants also had an opportunity to develop networks with those who are interested in supporting DEI, build their professional networks and learn from the diverse perspectives of their fellow participants.

Conference Key Areas: Engineering skills, professional skills, and transversal skills; Teaching the knowledge, skills and attitudes of sustainable engineering
Keywords: Transversal skills, sustainability, experiential learning, systems thinking, negotiation

ABSTRACT

This workshop addresses two major preoccupations in engineering education: the need to integrate sustainability and transversal skill development. In addition to knowledge about sustainability, engineering students require skills for effectively integrating these concepts into their work to both perceive opportunities and to convince others to adopt more sustainable approaches. It is these skills that are the focus of this workshop. Participants will experience an interactive activity with tangibles, designed for engineering students, that targets the development of 3 transversal skills relevant to sustainability: systems thinking, perspective taking and negotiation. This activity employs a three-facet framework for teaching transversal skills: knowing (strategies and models to implement the skill), experiencing (opportunities to apply the skills and encounter relevant difficulties) and learning by experience (meta-cognitive/emotional reflection to promote transfer). Workshop activities provide structured opportunities to consider how to create learning experiences that embody the evidence-informed criteria of providing relevant information on implementing the targeted skills, supporting low-stakes

[1] S. Isaac
siara.isaac@epfl.ch

experimentation, delivering timely feedback and encouraging transfer into future contexts. This workshop provides engineering educators with both a specific activity (https://doi.org/10.5281/zenodo.10731771) and a general framework (https://doi.org/10.5281/zenodo.13328581) for designing activities to teach transversal skills. Engineering students consistently express interest in developing their transversal skills and in sustainability. By exploiting their dual motivations, this workshop offers a practical way to equip students with skills fundamental for responsible engineers.

1 BACKGROUND AND RATIONALE

This workshop simultaneously addressed two major priorities in engineering education: the urgency to integrate sustainability (Lozano et al. 2013; Wilson 2019) and the need for transversal skill development (Kolmos and Holgaard 2019). In addition to knowledge about sustainability, engineering students require skills for effectively integrating these concepts into their work to both perceive opportunities and to convince others to adopt more sustainable approaches. It is these skills that were the focus of this workshop. Based on a practical framework for designing learning activities that teach transversal skills (Isaac, de Lima, Jalali, Rossi, Schmid, et al. 2024; Isaac, Petringa, et al. 2023), this workshop provided engineering educators a way to enhance transversal skills particularly focusing on the skills of systems thinking, perspective taking, and negotiation for their potential to assist students to promote sustainability (Isaac and de Lima 2024a).

How engineers frame problems has implications for the solutions envisaged, specifically by identifying which characteristics, boundaries, issues and approaches that are deemed relevant to be included. When engineers do not see sustainability as integral to engineering, it is rarely included in their problem solving (Isaac, Kothiyal, et al. 2023). While sustainability is not itself a skill, educating responsible engineers requires that students are equipped with transversal skills that promote sustainability in the products and processes they design.

Students are interested and ready to develop their transversal skills (Passow and Passow 2017; de Lima, Isaac, and Dehler Zufferey 2024a; 2024b) and are specifically interested in skills to support sustainability (Isaac, de Lima, Jalali, Rossi, Tormey, et al. 2024). While there is growing consensus that transversal skills must be explicitly taught (Picard et al. 2022; Isaac, Petringa, et al. 2023), engineering education is plagued by a persistent misconception that students will be able to develop their skills without specific pedagogical interventions (Isaac, Petringa, et al. 2023). We have identified the following three transversal skills as particularly relevant to develop engineering students' ability to integrate sustainability:

- **Systems thinking** is fundamental to a comprehensive understanding of complex phenomena (Senge 1990), such as the intersection of technological, environmental, societal and economic issues. Students often lack this skill (Huang et al. 2015), particularly as related to sustainability (Hiller Connell, Remington, and Armstrong 2012). This results in students being inadequately prepared to contextualise their problem solving in sufficiently broad and interconnected ways.

- Thoroughly **exploring different perspectives** and constraints improves the quality of solutions (Cross 2006) and creates scope to include elements from diverse stakeholders in how problems are formulated. It is pertinent to provide support for engineering students to develop this skill because while they have difficulty incorporating multiple stakeholder perspectives (Björklund 2013; Scott 2008; Zoltowski, Oakes, and Cardella 2012), their perspective taking skills have been found to be moderately correlated with their ethical reasoning (Hess et al. 2019).
- Establishing a common set of objectives or priorities among the different experts and stakeholders in a project is a major asset for decision making. **Negotiating skills** are therefore useful for all engineers to ensure that their concerns are perceived and valued by colleagues; the importance of negotiation skills is amplified for engineers who seek to promote sustainability (Svanström, Lozano-García, and Rowe 2008). Engineering student teams were found to obtain better outcomes when they received explicit training on negotiation skills (Jin, Geslin, and Lu 2007).

This workshop introduced engineering educators experientially and conceptually to a 3-facet framework for teaching transversal skills: ***knowing*** (strategies and models to implement the skill), ***experiencing*** (opportunities to apply the skills and encounter relevant difficulties) and ***learning by experience*** (meta-cognitive/emotional reflection to promote transfer) (Isaac, de Lima, Jalali, Rossi, Schmid, et al. 2024). Workshop activities provided structured opportunities for engineering educators to consider how to create learning experiences for developing transversal skills that provide relevant information on implementing the target skills, support low-stakes experimentation, deliver timely feedback and support transfer into future contexts.

The activity at the centre of this workshop used the selection of materials for a wind turbine to engage participants in a contextualised optimisation of sustainability through principled negotiation between multiple stakeholder perspectives. The learning outcomes for the workshop addressed the three transversal skills mentioned above: perspective taking, systems thinking, and negotiation (Isaac and de Lima 2024a). Participants first assumed one of 4 engineering roles to identify specific sustainability priorities based on their responsibilities and expertise of these functions (mechanical engineer, geological engineer, production manager, and project coordinator). Next, using a physical prototype of a wind turbine to increase the visibility of the outcome, they negotiated from the perspective of their assigned roles to optimise the choice of material for the wind turbine. This activity has been consistently well received when facilitated for Bachelor and Masters students, as well as faculty, at several European institutions.

In the second part, participants used the framework (Isaac, de Lima, Jalali, Rossi, Schmid, et al. 2024) to analyse the experiential activity and identify how students' transversal skills development was supported. The facilitation guide for the activity (https://doi.org/10.5281/zenodo.10731771) and worksheets for creating activities to teach transversal skills (https://doi.org/10.5281/zenodo.10992806) are available as open-source resources.

2 WORKSHOP LEARNING OBJECTIVES

This 60-minute workshop engaged participants in

- Applying skills of perspective taking, systems thinking, and negotiation to promote sustainability in collaborative engineering projects.
- Characterising experiential learning situations effective for teaching transversal skills to engineering students.
- Analysing how to integrate better support for students to develop their transversal skills in engineering courses.

This workshop was designed for engineering educators and pedagogical advisors interested in developing teaching activities for transversal skill development. Prior knowledge of transversal skills, sustainability or teaching experience was not required.

3 WORKSHOP DESIGN

The first part of this workshop was an experiential activity that teaches three transversal skills valuable for promoting sustainability: perspective taking, systems thinking, and negotiation. In the second part, participants analysed the activities of part one to identify pedagogical interventions relevant to the 3 facets of the framework for teaching transversal skills.

Table 1. Activity schedule for the 60-minute workshop

Duration	Activity	Mode	Material
Part One			
5 min	Welcome, learning objectives	Whole group	• Slides
5 min	Warm up: Models of sustainability	Small groups	• LEGO blocks
5 min	Presentation: How perspective taking, systems thinking, and negotiation skills support strong sustainability approaches	Whole group	• Slides
25 min	Wind turbine activity a. Determine priorities in role groups b. Negotiate materials for wind turbine prototype in mixed groups	Small groups in a jigsaw rotation	• LEGO prototypes of wind turbines • Roles handout Interdisciplinary team decision handout
5 min	Individual reflection + group debrief	Individual	• Slides
Part Two			

5 min	Presentation: 3-part framework for teaching transversal skills	Whole group	• Slides
10 min	Meta Activity: applying the framework to present workshop + chapter walk through	Small groups	• Activity outline (per Chapter)
5 min	Conclusion	Whole group	• Access to resources to duplicate / adapt the workshop
			•

4 OUTCOMES OF WORKSHOP

This workshop was based on an activity created by the 3T PLAY team that is designed to help teach skills that promote sustainability (Isaac and de Lima 2024a). The design of the activity, and the workshop, explicitly incorporates the three aspects of the 3T PLAY Trident framework (Isaac, de Lima, Jalali, Rossi, Schmid, et al. 2024). Additional activities that target other transversal skills have also been developed by the team (3T PLAY 2024). Additionally, educators can design activities that target transversal skills of their choice using a self-guided self-paced guide based on the framework (Isaac and de Lima 2024b). All these open-access resources are available online: https://zenodo.org/communities/3tplay/records

ABSTRACT

Artificial Intelligence (AI) in mathematics education has been gaining momentum, with various applications promising to transform teaching and learning processes. The pros and cons of incorporating AI in mathematics education can be analysed through multiple lenses, including pedagogy, accessibility, personalization, and data security. while AI offers promising opportunities to enhance mathematics education through personalized learning, engagement, and accessibility, it also presents challenges related to data privacy, equity, reliance on technology, and implementation. Balancing these pros and cons requires careful consideration and a thoughtful approach to ensure that AI's integration into mathematics education maximizes benefits while mitigating potential drawbacks. A questionnaire followed by a debate was promoted with participants at the SEFI Mathematics Special Interest Group workshop held in Lausanne at the SEFI annual conference.

In this paper, we will present the results of the referred questionnaire and debate involving 20 teachers from 14 countries at the SEFI'2024 conference. This questionnaire delved into teachers' perspectives on utilising AI and ICT Integration in Mathematics Engineering Education with the purpose of enhancing learning and teaching.

1 MOTIVATION AND LEARNING OUTCOMES

With this workshop, the authors intend to discuss and survey how its participants are using Artificial Intelligence software, platforms, ICT, and their achievements in terms of consolidated knowledge, together with teaching challenges that may be anticipated.

Attendees will be invited to answer some specific questions regarding AI assistance platforms, and software possible to use while teaching and/or learning Mathematics and perform an evaluation of how their perception of the knowledge is acquired by their students. The emergence of ChatGPT and how its usage may be an ally to students' knowledge tutoring, but also as a fountain of misunderstanding concepts and incorrect application will also be discussed.

After collecting the above information, a discussion/reflection period between the attendees will be promoted to generate conclusions that are fruitful and may be accomplished by Mathematics teachers when returning to their universities. A not necessarily equal but similar way of teaching and learning mathematics across Europe is crucial for fostering educational mobility and enhancing students' mathematical competence. By aligning pedagogical methods, curricula, and learning outcomes, students can benefit from a harmonized educational experience that transcends borders. Collaboration, consistent academic standards, and a strengthened European identity are the fruits of such endeavours. Embracing this shared vision of mathematics education will prepare students to tackle the challenges of a globalized world and contribute to the development of a highly skilled and interconnected workforce.

2 BACKGROUND RATIONALE AND RELEVANCE

Mathematics education plays a critical role in developing analytical thinking, problem-solving skills, and logical reasoning abilities among students. With the fast advancements in technology, the integration of Information and Communication Technology (ICT) has opened up new possibilities for teaching and learning mathematics. In the past 3 to 4 years, the emergence of ChatGPT usage by students worldwide generated mixed feelings inside the teaching community. In the field of engineering education, the use of different tools and pedagogic methodologies has gained significant attention due to their potential to enhance mathematical understanding and application within an engineering context. This workshop delves into the state of the art in teaching mathematics, emphasizing the integration of AI techniques in engineering education and their evaluation by the workshop attendees.

It is recognised by the academy that Mathematics and Physics serve as foundation disciplines for engineering courses, and it is also stated by the teachers' community that a solid mathematical background is crucial for students to succeed in their engineering education and future careers. Traditionally, mathematics was taught using traditional pedagogical methods such as lectures, textbooks, and pen-and-paper exercises. However, the integration of AI and ICT tools significantly enhanced the teaching and learning experience. Interactive simulations, computer algebra systems, graphing calculators, educational software, and online resources offer dynamic and engaging platforms for exploring mathematical concepts. By integrating ICT/AI in Mathematics Education the learning experience is enhanced since these tools provide: interactive and engaging experiences for students helping with simulations, visualization, and multimedia content which promotes understanding of abstract concepts; personalized learning and differentiation since AI-powered adaptative learning platforms allow personalized learning experiences tailored to individual student needs. Adaptive software and online platforms can provide targeted instruction, immediate feedback, and adaptive challenges, catering to students' unique learning styles and paces; immediate feedback to students on their answers and progress, allowing them to identify and correct mistakes in real-time. This feedback loop promotes active learning, encourages experimentation, and reinforces learning behaviours (feedback within courses with many students is always a hard process difficult to be successfully achieved); collaborative learning since AI/ICT tools enable collaborative learning experiences, facilitating communication and collaboration among students. Virtual platforms and online forums create opportunities for students to discuss, solve problems, and share mathematical insights, fostering a collaborative and supportive learning environment.

In Engineering Education, integrating ICT tools and AI in mathematics instruction has become increasingly prevalent and necessary. Engineering-specific software packages, computational tools, and programming languages provide students with practical applications of mathematics in engineering contexts. Using virtual laboratories, simulation software, and data analysis tools helps students connect mathematical concepts to real-world engineering problems. Nevertheless, AI models have limitations, especially in areas where comprehension may be less accurate and reliable since it relies on patterns and context learned to generate answers. It is time for teachers to embrace the challenge and anticipate pedagogical and teaching methodologies that may cope with all the good provided by AI but also give students competencies that allow true knowledge to be acquired.

3 SIGNIFICANCE FOR ENGINEERING EDUCATION, ENHANCEMENT OF KNOWLEDGE AND DIALOGUE, AND ATTRACTIVENESS OF THE WORKSHOP TOPIC

It seems widely accepted that the integration of AI/ICT in mathematics education, particularly in the field of engineering education, has transformed traditional teaching and learning approaches. By leveraging the power of technology, educators can enhance students' understanding, engagement, and application of mathematics. As technology continues to advance, embracing ICT integration in mathematics education becomes imperative to prepare students for the challenges and opportunities of the engineering profession.

In an increasingly interconnected world, fostering education mobility has become essential for preparing students to thrive in a globalized society. Within the realm of mathematics education, promoting not necessarily equal but similar teaching and learning approaches across Europe holds great importance. Harmonizing mathematical education methods and fostering mobility among students, emphasizing the advantages of a shared pedagogical framework in promoting educational excellence and enhancing students' mathematical competence is a preoccupation of some teachers. Europe is a diverse continent with a multitude of educational systems and approaches to teaching mathematics. While each country has its unique cultural and educational context, fostering a more similar framework of mathematics education can bridge the divide between different systems. This ensures that students, regardless of their geographic location, have access to high-quality mathematics education and can seamlessly transition between educational systems. Promoting a similar approach to teaching and learning mathematics across Europe facilitates educational mobility for students. When mathematical concepts and pedagogical methods align, students can transfer their knowledge and skills more easily when moving between countries or participating in international exchange programs. This mobility opens doors for students to experience different educational systems, gain diverse perspectives, and develop adaptability skills. A shared understanding and implementation of mathematics education methods can contribute to the establishment of consistent academic standards across Europe. By aligning curricula, learning outcomes, and assessment practices, educational institutions can ensure that students receive a comparable level of mathematical education, regardless of their location. This consistency fosters transparency and helps students and employers recognize and evaluate mathematical competence uniformly.

Promoting similar teaching and learning approaches in mathematics encourages collaboration and knowledge exchange among educators across Europe. When educators share best practices, pedagogical strategies, and innovative approaches to teaching mathematics, it enriches the professional development of teachers and contributes to the continuous improvement of mathematics education. This collaboration can occur through teacher training programs, conferences, online platforms, and professional networks. By embracing a shared pedagogical framework, Europe can foster a sense of unity and belonging among its diverse nations. This shared educational experience helps create a cohesive community, where students can learn from one another, appreciate cultural diversity, and develop a deeper understanding of their European counterparts.

4 WORKSHOP DESIGN

The following bullet points summarize the content of the workshop and its design:

- A 10-minute activity showing the most common AI and ICT tools used by Mathematics teachers
- A 10-minute activity of individual reflection and questionnaire answers
- A 30-minute discussion/reflection among all attendees
- A 10-minute wrap-up and conclusions document construction to take away

5 RESULTS AND CONCLUSIONS

Twenty individuals from 14 countries, Fig. 1, attended the workshop and answered the proposed questionnaire.

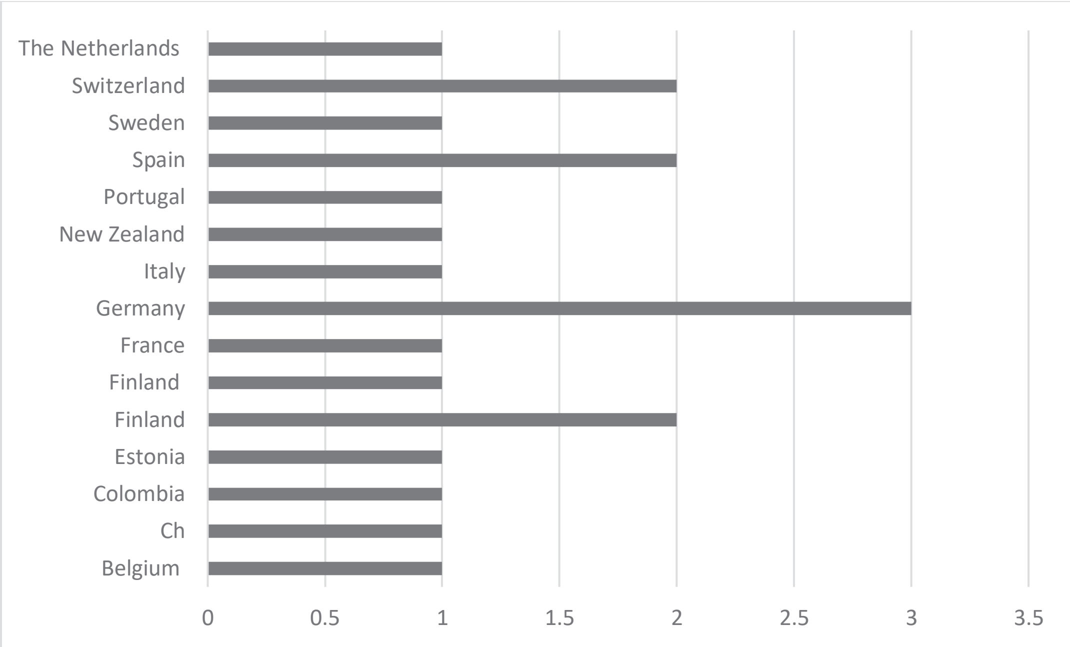

Fig. 1. Attendees' origin country

The gender distribution was balanced between individuals, as shown in the pie chart below, which allows us to analyse possible different perspectives.

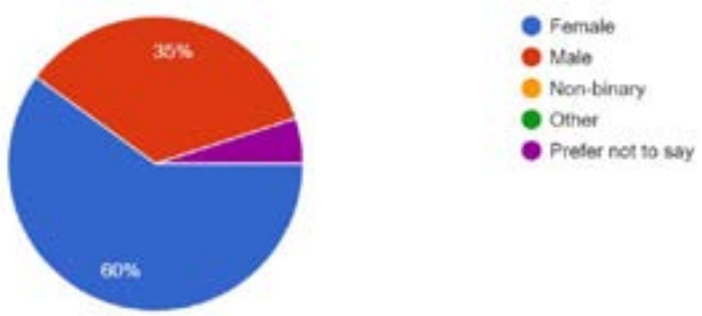

Fig. 2. Attendees gender.

The years of teaching experience among workshop attendees were also considered an important variable that could potentially influence the subjects being discussed. As evident from the histogram in Fig. 3, representing attendees' years of teaching experience, the sample includes individuals from all experience levels.

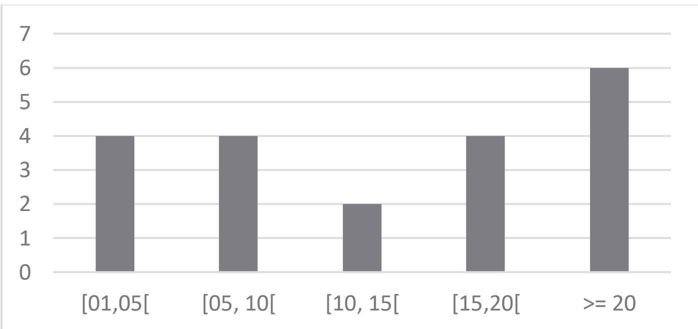

Fig. 3. Attendees teaching experience years.

From a list of possible Mathematics curricular units, which may have different strategic pedagogical approaches, attendees were asked to choose which ones did they teach. At Fig. 4 we may observe their answers:

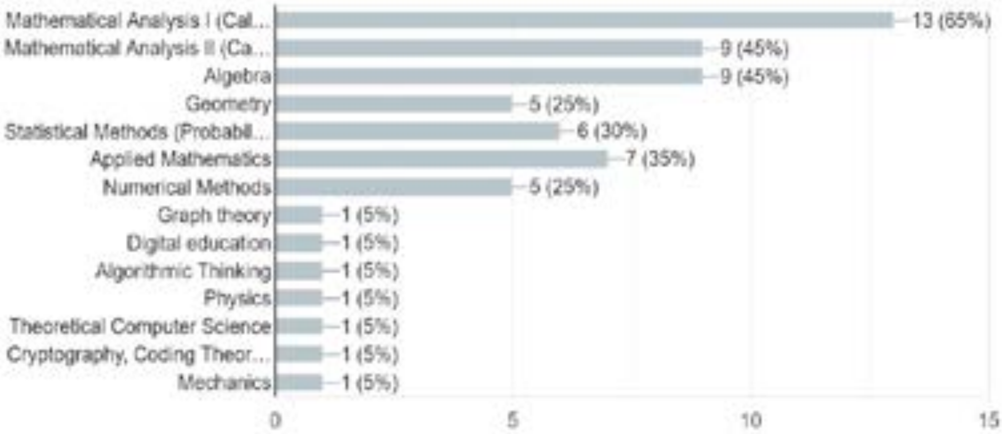

Fig. 4. Attendees' curricular units taught.

Regarding different pedagogical strategies, Fig. 5, we observed that all attendees use at least one pedagogical strategy besides standard education model (expository using only blackboard).

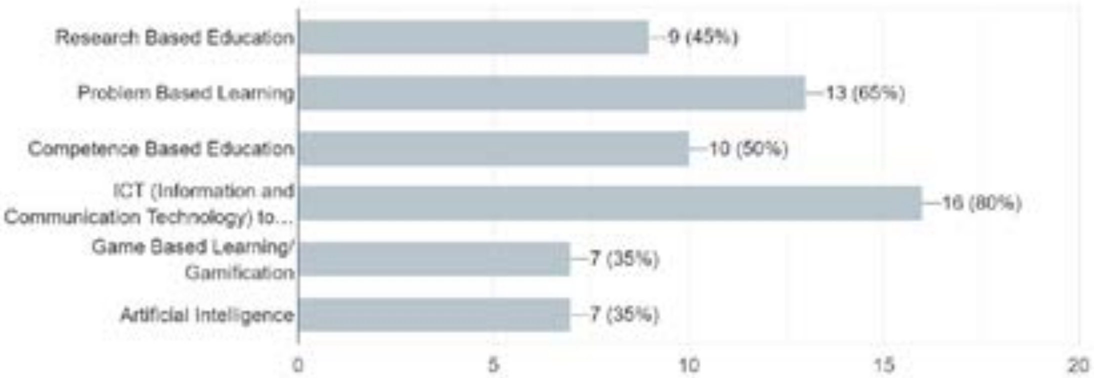

Fig. 5. Attendees' pedagogical strategies

When asked about the frequency with which the above-mentioned pedagogical methods were applied, we may observe, Fig. 6, that their applicability is higher than half the number of classes taught within a semester (1-Rarely and 5-Within almost all classes).

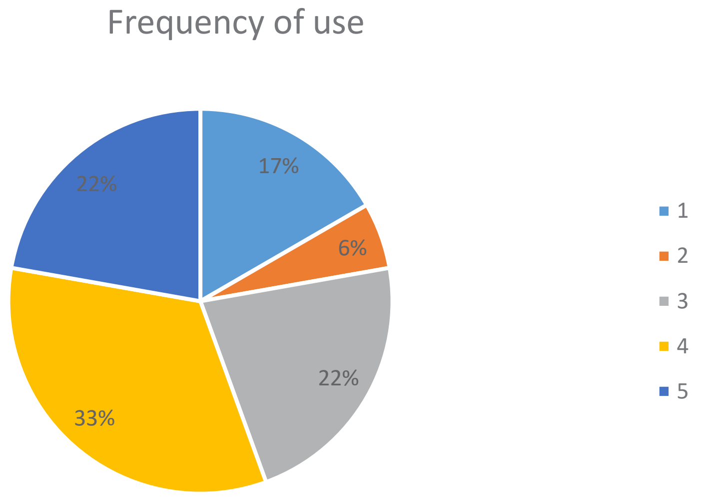

Fig. 6. Attendees' different pedagogical strategies usage

When trying to apply these strategies difficulties arise and the pointed main ones that attendees face when overcoming traditional pencil and paper Mathematics classes were, Fig. 7, the time to teach all contents needed and the difficulty of adapting curricula followed by financial conditions and insufficient ICT conditions available.

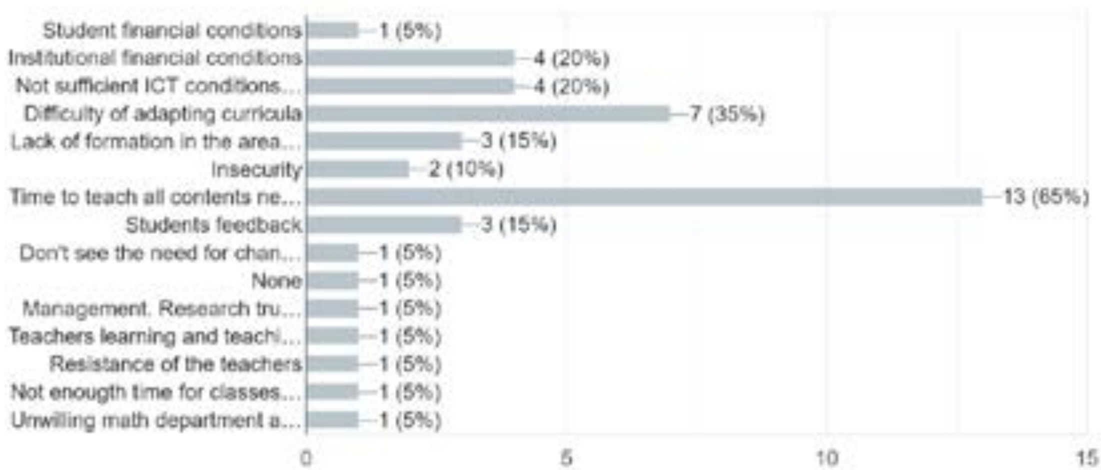

Fig. 7. Attendees' main difficulties regarding the applicability of different strategies

In future endeavours, fostering synergies between those responsible for engineering curriculum development and mathematics teachers should be regarded as an important theme.

The purpose of ICT tools usage inside classes are, for the present attendees, Fig. 8:

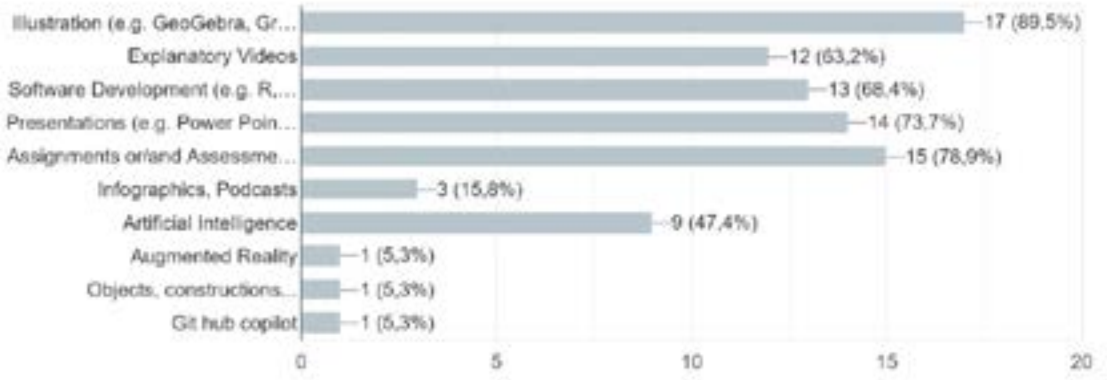

Fig. 8. Attendees ICT tools usage purpose

Regarding AI tools and the question “Which of the following AI tools do you use while teaching?” we observe, Fig. 9, that Wolfram Alpha and ChatGPT are the most used, followed by MATLAB and Python.

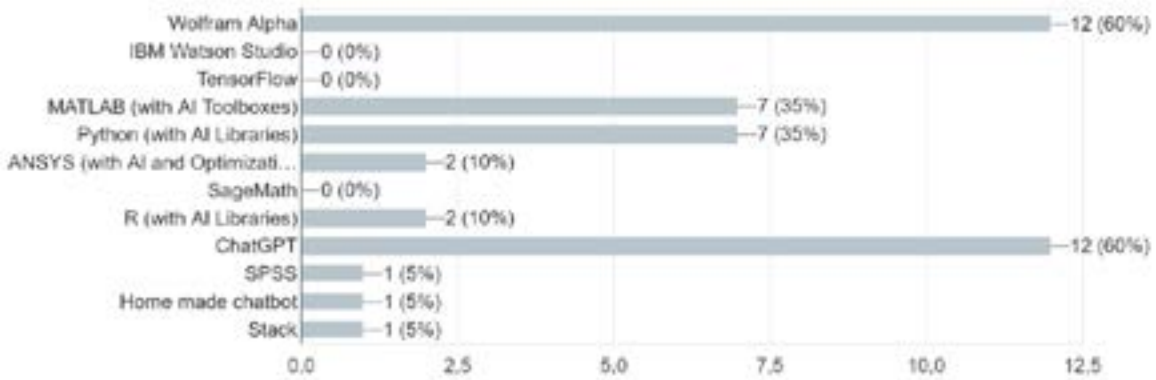

Fig. 9. Attendees AI tools usage

At workshop participants' curricular units’ classes, students may use some AI tools. The ones allowed are shown in Fig. 10:

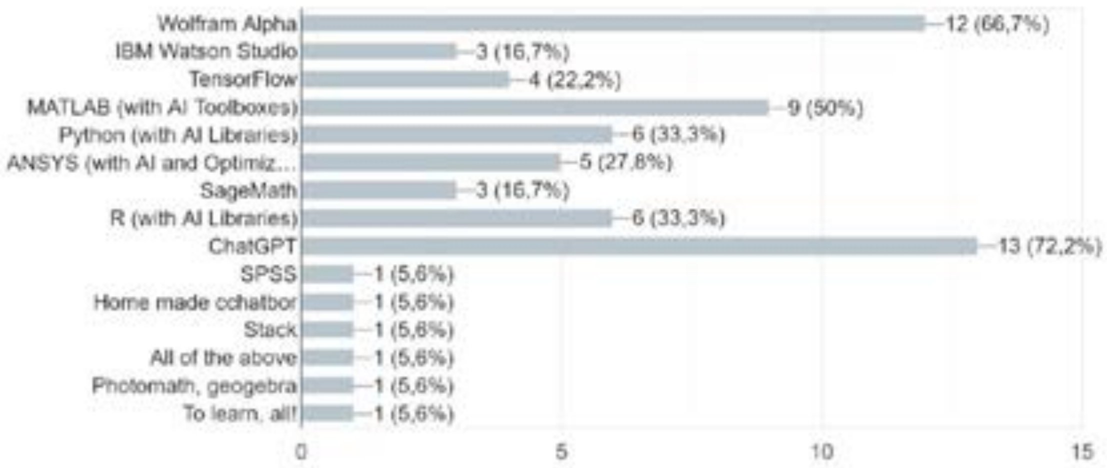

Fig. 10. AI tools used by participants students.

When asked about the main concerns while participants' usage of ChatGPT, the answers were:

- Hallucination
- Security
- Privacy/errors in content generated
- none
- Inequities in access and cost. Otherwise, a great helper in work, especially in programming and scripting.
- Added workload because of mathematical errors
- Lack of knowledge about tool and their limitations
- The varying results. Sometimes the results and proofs for example mathematical induction or optimization problems of two variables are different if you ask ChatGPT to produce the solution consecutively.
- Not the same definitions I use
- Cannot realise errors if you don't have previous knowledge
- Uncertainty in results
- Ethic

As for students' usage of ChatGPT participants concerns are:

- Wrong use
- Students are (usually) not able to detect the mistakes it states very confidently. Lack of critical attitude. Some students to see it as a quick win tool. Are they learning?
- Security
- Errors and privacy
- Students do not notice when AI is wrong
- Correctness of the answers and capacity of students to recognize errors
- Overreliance and not learning
- Incorrect answers, misleading explanations. Use for academic misconduct instead of learning methods
- Correctness of the answers provided by ChatGPT, students' ability to formulate good questions, no graphical supports
- No critical thinking on their own
- The likewise above
- Do not reflect the answers
- Same, students lack knowledge, they agree with all IA says
- Cheating
- The student's ability to be critical about texts and solutions provided; Ethics; Losing their ability to think and rationale by themselves

Participants expressed concerns regarding using AI tools other than ChatGPT, citing issues such as their perceived opacity ('black box'), potential for deskilling, similarity to one another, or a lack of competence in effectively utilizing them. For students, the use of AI tools different from ChatGPT presents the following concerns:

- Black box
- Deskilling
- I have no control over the answers and the feedback they provide them, and I don't know if the answers are aligned with what was done in the classroom.
- Overreliance and not learning.
- We've been dealing with overreliance on Wolfram Alpha and Symbolab since before COVID.
- The same
- Similar

- Lack of competence

Students' feedback, Fig. 11, regarding the use of the AI/ICT tools is encouraging as expected.

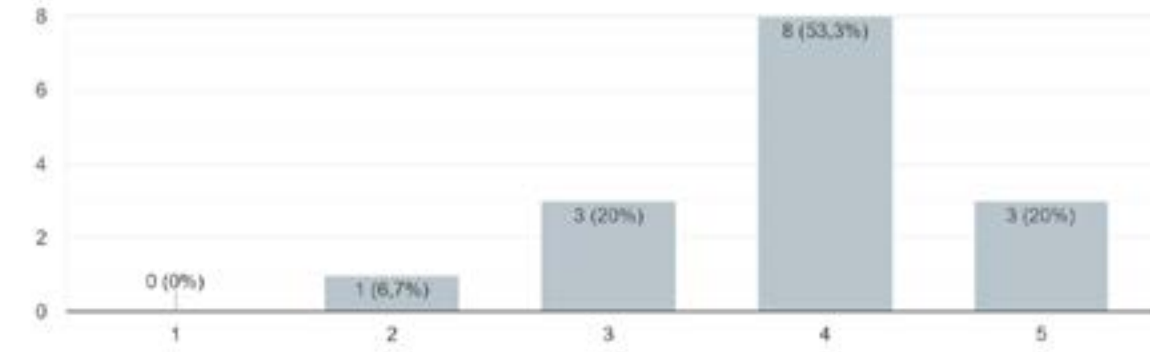

Fig. 11. Attendees' students feedback

At the conclusion of the semester, attendees' perception of students' apprehending mathematical concepts is moderate. This suggests that nearly all students grasp the concepts to some extent, although they may not achieve expertise. However, the concepts can be considered as having been apprehended by the students.

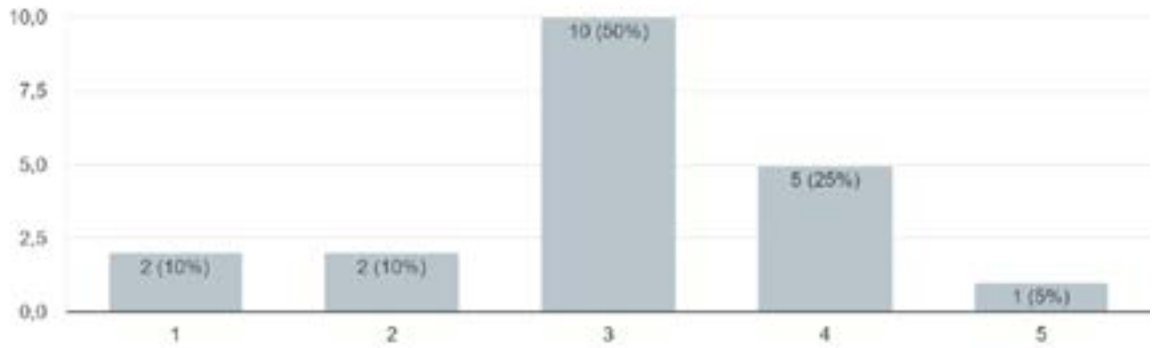

Fig. 12. Attendees' student's concepts apprehension (1 – Not apprehend;5 – Experts)

Nevertheless, apprehending the concepts is not a synonym of rigorous application and the attendees' perception regarding the rigour with which the Mathematical concepts were grasped reflects it, Fig. 13.

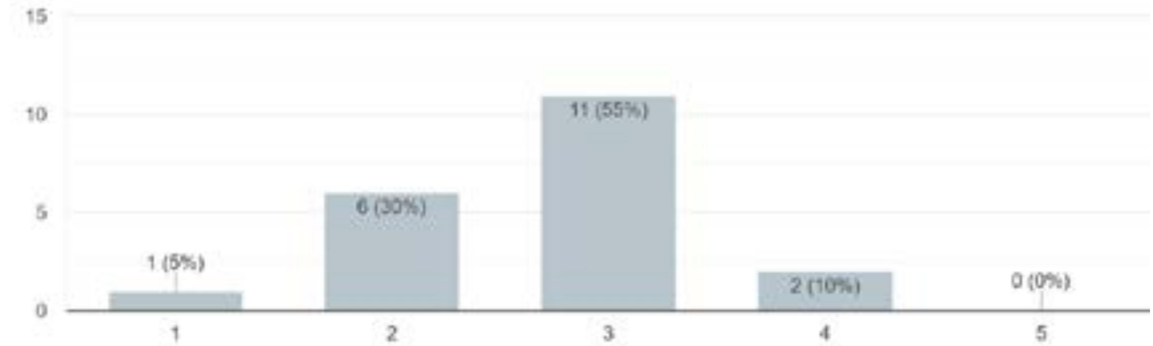

Fig. 13. Attendees' student's concepts rigour (1 – Not rigorous; 5 – Absolutely rigorous)

Authors were also interested in understanding which Mathematical competences were most valued by the attendees. The answer to that question reveals that to the attendees present at this workshop the most valued competences are the ability to be critical about the solution obtained and also the ability to apply the acquired knowledge to a different situation as we may observe on Fig. 14 a) b):

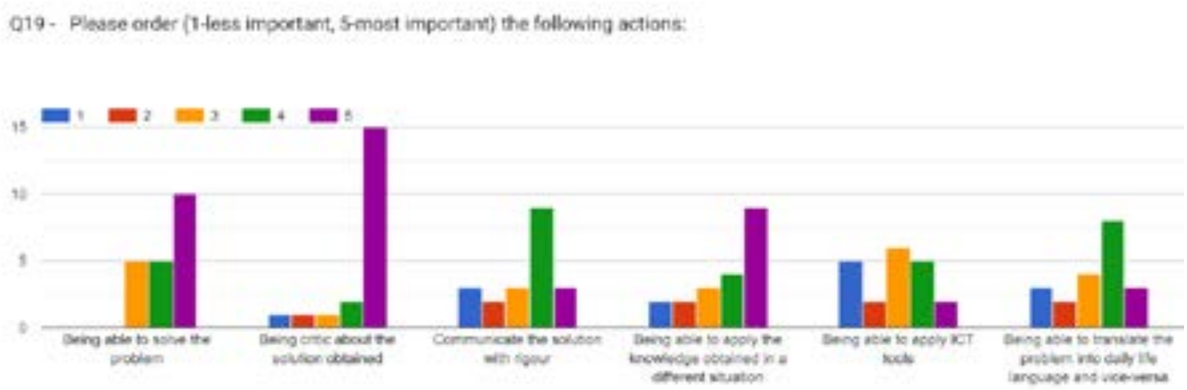

Fig. 14 a). Attendees' competencies ordering

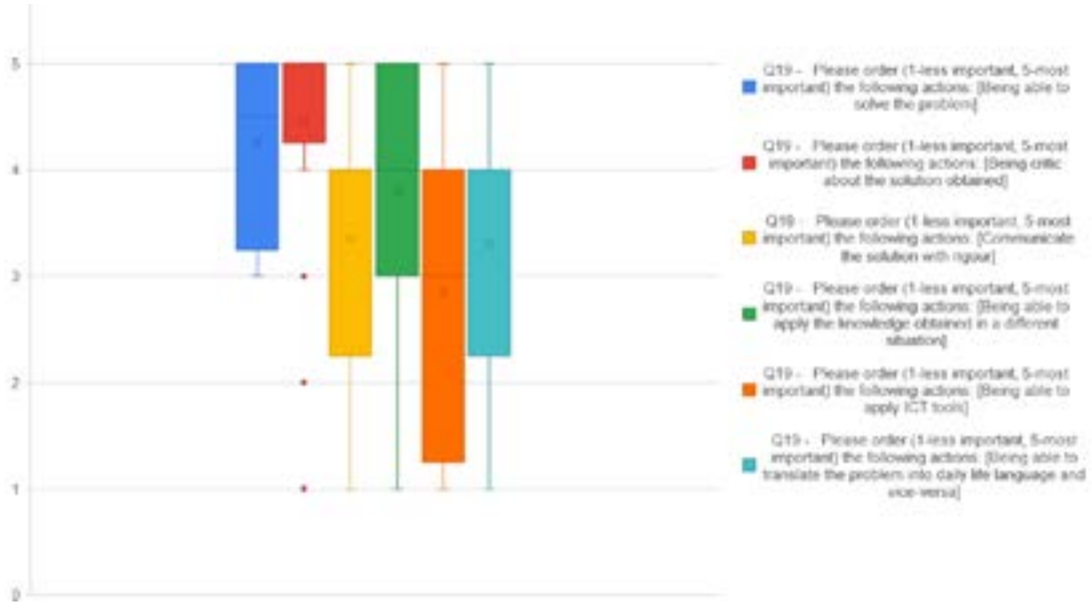

Fig. 14 b). Attendees' competencies ordering boxplot comparison.

At the end of the questionnaire authors asked attendees to share some fruitful educational experience in terms of pedagogy, ICT tools used, assessment procedures, AI, etc., and the inputs received were the following:

- Students use it whether we like it or not, we have to give them some guidance
- Students use ChatGPT for a curve sketching question and correct it (if any mistakes are detected).
- Solving problems with any ICT tool
- Forums allow to an increase grades of weaker students
- A PBL (problem-based learning) class about coding.
- Critiquing ChatGPT solutions make for good exercises in critical thinking, and students find this challenging - even the latest releases still make mistakes and carry the errors through!
- Discussion with students

6 ACKNOWLEDGMENTS

The authors extend sincere gratitude to the audience of the Mathematics Special Interest Group workshop for their keen interest and active participation.

The first author acknowledges deeply the financial support provided by GIRLS Erasmus+ project: KA220-HED-285023E0.

Motivation

At the 2021 Annual SEFI Conference, the SEFI Ethics SIG proposed the idea of a Handbook developed by the community and launched an invitation to contribute during the workshop which asked participants whether they are “Eager to contribute to an Engineering Ethics Education Handbook?” (Børsen et al, 2021). The workshop attracted many participants interested to become co-authors, who during an active brainstorming section suggested other potential contributors and key themes that made their way in the handbook as co-authors and as chapters or sections. Three years later, this project is becoming a reality and *The Routledge International Handbook of Engineering Ethics Education* (Chance, Børsen et al, 2024) is soon to be launched, featuring 108 authors who collaborated in the development of 36 chapters “mapping” the field of engineering ethics education.

This project would not have been possible without the support of the community, and we want to celebrate with you and think together about next steps for continuing this project, alongside other interested engineering ethics teachers and researchers, as part of a rapidly growing community. The 2024 SIG workshop took stock of key advancements in the field of teaching the ethics and philosophy of technology, while looking ahead by making a series of recommendations for the next decade.

In the same collaborative spirit that was at the core of the development of *The Routledge International Handbook of Engineering Ethics Education*, we invited workshop participants to think alongside the editors what’s next: while celebrating the launch, to continue seeing the Handbook as an evolving project. This editorial project is a project that is continuously shaped by the European and non-European members of the engineering ethics education community, and responsive to emerging issues in ethics and the philosophy and technology as well as to recent calls for broadening the cultural inclusivity and the use of non-Western ethical frameworks.

Let’s think together of the next decade of engineering ethics education and how we, as a community, can contribute to the development of the field!

1 Theoretical background

Writing a handbook implies “mapping” the fundamental information needed by those teaching or researching in a field. This is a challenging task when the field is still maturing. This handbook grew from the idea that we could ‘collaboratively write’ engineering ethics education, and in doing so, striving to ‘decolonize’ the discourses that have traditionally dominated engineering ethics education and offer geographically and culturally diverse perspective on this field.

While we are indeed using the “mapping” metaphor, we do so conscious that it refers to past colonial practices, and as such we have encouraged authors to reflect on their positionality and be part of multi-cultural and geographical inclusive chapter teams. Mapping also refers to attempts to shift one’s perspective as to visualize a field from above, and to the continuous and unending task of striving to provide a representation of the reality we experience as teachers, researchers or citizens, that also continuously changes in response to current developments, pressing societal needs and to our own spiritual awakening. As technology and educational science are changing, what we know about engineering ethics education is changing, too. And so, any attempt to map the space of engineering ethics education will only ever represent a snapshot of that territory at a given moment in time. This process requires continuous effort from us, the cartographers of this field, across cultures and geographical borders.

2 Workshop structure

The workshop began with a short presentation of the forthcoming Routledge Handbook of Engineering Ethics Education by the editorial team. This includes details of the organisation of the Handbook, its origins as a SIG Ethics community project and the collaborative process behind its development, as well as insights on its significance for the engineering ethics education community.

This presentation was followed by an active session, where participants worked in groups on a theme related to a section in the handbook (foundations of engineering ethics education, ethics issues specific to the different engineering fields, dialogue with other disciplines, teaching methods, assessment, accreditation). The participants discussed what are for them the key challenges and developments noticed in connection to each theme. Based on these, each group proposed recommendations for developing the field or highlighted emerging areas of interest. An example of a new working topic proposed is care ethics.

The session concluded with a discussion of the next steps needed to continue the handbook initiative in a participatory manner, as to include not only those who contributed but also those who did not have the chance to be authors in the volume. Potential options include a post-workshop publication and identifying a thematic focus for the next SEFI Ethics Spring School.

3 Key takeaways

At the end of the session, the participants left with:

(a) An enhanced awareness of recent trends and developments in the field of engineering ethics education, including of a new resource that they may use in their teaching and research (i.e. the forthcoming Routledge Handbook of Engineering Ethics Education)
(b) The opportunity to be further involved in processes of the SEFI SIG Ethics community meant to expand or complement the forthcoming Routledge Handbook of Engineering Ethics Education

4 Significance for engineering education

Engineering ethics education is a maturing field that is rapidly expanding. A major driver is represented by current expectations related to the societal responsibility of engineers and the need for engineering education to prepare its graduates for the complex sociotechnical challenges they will face.

The SIG Ethics workshop strives to bring together novices and experienced engineering ethics teachers and researchers alike to empower them to take personal action in further building the engineering ethics education community. Are you *eager* to contribute to further develop engineering ethics education and join us?

ABSTRACT

The past decade or two have seen a renewed emphasis on curriculum design and the advent of a new set of approaches to help ensure the development of a programme structure which supports student progression. In this workshop, members of the Curriculum Development special interest group (SIG) worked with colleagues from a wide range of institutions to consider how to approach the design of a holistic and integrated curricula. We introduced common curriculum models and gave an example of a curriculum design methodology to help attendees consider how they might apply a holistic curriculum design process in their own institutional context.

1 MOTIVATION & LEARNING OUTCOMES

Curriculum development is the systematic process that defines and delivers what will be taught, who will be taught, and how they will be taught within an educational programme. It involves the planned, purposeful, progressive, and holistic process to create positive improvements in an education system so that our graduates are best prepared to maximise their future. As such it draws together threads of core content, engineering and transferable skills and pedagogic approaches to create an amalgamated set of learning experiences to meet the intended programme-level outcomes.

To achieve this, a number of curriculum frameworks have been developed. Some notable examples include the Connected Curriculum (Fung 2017) which aims to provide an outline of how relationships to connect students with research, the public, the workplace and each other across disciplines, can be formed within the design of a curriculum. Within engineering, many examples of curriculum revisions follow models such as CDIO, Conceiving — Designing — Implementing — Operating (Crawley et al., 2014) which provide a framework for a curriculum that features aspects of design-build-test based project-work and an integration of skills development. It promotes a curriculum organised around mutually supporting courses, but with the CDIO activities highly interwoven in what we would term, an integrated curriculum. An integrated curriculum suggests that the learning that students undertake is delivered across traditional subject areas, with the learning experiences designed to be mutually reinforcing and staged in a manner that allows for increases in depth and complexity. As a concept it has been popular in schools, and in higher education there have been a number of notable programmes from the late 90's onwards (see Froyd and Ohland, 2005). In this workshop we used the ABC curriculum design process as developed by Young and Perović (2016).

When considering the design of a curriculum it is common to consider the curriculum as having four elements as defined by Bernstein (2000). Firstly, there is the planned curriculum. This is the curriculum that is designed, developed and ultimately validated through bureaucratic university processes. It is ultimately driven by the local or national approvals process – however, this would deny the central value and artistry in such planning. The complex requirement to balance often conflicting interests while recognising legacy and context, mean that this is a challenging task. In recent years, learning design tools have been developed to support practitioners in ensuring that all the inherent and sometimes conflicting concerns can be captured and incorporated. Examples include ABC (Young and Perović 2016), ICEBERG (Weller, van Ameijde, and Cross 2018), or Carpe Diem (Armellini, Salmon & Hawkridge 2009).

Secondly, there is the delivered curriculum, the manifestation of the designed curriculum when put into practice. In an ideal world, this will be simply the practical realisation of the planned curriculum, however, it is often more complex. For example, it is common that different staff will have engaged in the process as the curriculum moves from design to delivery, leading to modification and adaptions when the planning curriculum is actually delivered.

Thirdly, there is the received or perceived curriculum, terms which acknowledge that the curriculum received by students may differ from that proposed or delivered by staff. Finally, and perhaps most crucially, but most often ignored during the design stages, is the hidden curriculum. This is the curriculum that is not formally specified, but that is often acutely felt by the students as it often embodies the processes and cultures of the university or department.

Central to many of these approaches is the concept of a curriculum that builds and develops as student progress through it. This is often referred to as a spiral curriculum (Harden and Stamper 1999). It provides students with an opportunity to iteration and revisit important elements of learning such as key skills throughout the curriculum. This concept is based off the work of Bruner (1960) and has proved popular as it encourages reinforcement and integration of knowledge through a process where new learning is built on previous learning.

2 WHY IS THE SESSION RELEVANT AND ATTRACTIVE FOR THE AUDIENCE?

Although all universities have a curriculum, it is often difficult, even for those within the organisation, to see exactly how it was originally designed. This may be because the design has been in place for some time, because it has been driven by outside forces such as accreditation or national regulation, or, because it has grown and developed somewhat organically, with modules evolving and the whole rarely being considered. It should also be recognised that what influence an individual can have over the curriculum may well depend on the structures within the university and/or nationally. In some jurisdictions, especially those with credit-hour systems, it is hard to fully prescribe the content and timings of the elements that the students will meet. In others, there is far more opportunity to structure the learning activities to build threads and progressions within the curriculum.

This workshop presented an approach to curriculum design, drawing on the context of participants institutions and a range of widely used models to enable a high-level design of a holistic and integrated curriculum to be produced.

3 WORKSHOP PLAN:

The workshop began with a short presentation of the key approaches to curriculum design. Participants will be asked to consider their key curriculum objectives in the context of their own educational mission. We then introduced a reduced version of the ABC (Young and Perović 2016) framework for curriculum design and allowed participants to undertake this exercise in small groups to identify approaches to structure a curriculum that will lead to the to their curriculum objectives. The session concluded with a feedback session to capture the major insights of the facilitators and participants of going through this process.

A group of facilitators with experience in curriculum development were present to support the 50 participants in attendance. Although this workshop was ideally suited to those with curriculum leadership responsibilities, it was clear that it was of value to all those who are interested or aspire to consider the design of the programmes beyond the module level.

4 Output of the Workshop:

The ABC activity is usually undertaken in a workshop of at least 90 minutes, and so only a reduced version was possible in the confines of this workshop. However, it is hoped that the key strategies of this approach were apparent. Participants were asked to first identify a programme level learning outcome that they wished to see in their graduating students and articulate this in one sentence. From this they should collaboratively identify the key skills that students should be developing as they progress through their programme if they are to meet this learning outcome. Finally, supported by the ABC learning designer categories (Acquisition, Collaboration, Discussion, Investigation, Practice, Production), groups should consider what activities students should engage in to develop these skills.

A range of topics were considered by the groups including:

- Curricular Community Engagement
- Developing an understanding of sustainable principles in engineering
- Students should be able to work together and collaborate
- Ability to solve complex problems
- Be able to critically evaluate ones' own results and actions and those of others
- Ability to apply systems thinking principles to address complex problems
- Evaluate consequences of the outcomes of a project
- Online collaboration in active learning
- Develop engineers with a systems perspective
- Reflectively design an energy engineering project.

Although not all groups achieved the full set of tasks, many fruitful conversations were had and in the workshop demonstrated the need for holistic curriculum design across multiple years to achieve programme level learning outcomes.

***Conference Key Areas**: Building the capacity and strengthening the educational competences of engineering educators; Educating the whole engineer: teaching through and for knowing, thinking, feeling and doing*
***Keywords**: Capacity building, culture, emotion*

1 MOTIVATION AND OUTCOMES

1.1 Motivation

This workshop was organised by the Capacity Building SIG: an international and interdisciplinary group of educators and researchers interested in a broad understanding of capacity building, such as teacher pedagogical training and PhD student and researcher development. The aim of this workshop was to explore the intersection between capacity building and the conference theme of educating socially responsible engineers.

Educating socially responsible engineers requires moving beyond developing students' technical knowledge and skills to also fostering their personal and social responsibility [1]. The literature variously uses terms such as “21st century skills" [2], "professional competencies", but also "empathy" [3][4], "inner development goals" [5], and "educating the whole engineer" [6]. Redirecting engineering education in these areas can be challenging for educators who have not received any training for teaching other than the technical aspects of engineering. Therefore, capacity building is particularly important for educating socially responsible engineers.

With this motivation, there were three parts to the session: brief introduction to the workshop goals and terminology, rotating pair conversation, and panel discussion. After establishing common language and situating the workshop aim, the second part provided participants with the opportunity to self-select into three topical groups that explored how we approach teaching material at the intersection of technical skills and skills for responsible citizenship, and the responsibilities and pressures that this places on the educator. Through these pair conversations, participants developed reflective questions that they posed to the panellists in the third part of the workshop. There was no background knowledge or capacity building experience required for participants.

1.2 Outcomes

The aim of the workshop was to provide a safe space for exploring staff capacity building related to educating socially responsible engineers. The session was designed to achieve the following outcomes:

- Develop a better understanding of how we, individually and collectively, approach capacity building for educating socially responsible engineers
- Develop awareness of diverse ways in which emotion and culture influence our approaches to capacity building for educating socially responsible engineers
- Share concrete ideas of how we can improve capacity building practise in this context
- Build a community of educators and researchers who, from diverse disciplinary and practice-based vantage points, share an interest in strengthening capacity building for educating socially responsible engineers.

2 BACKGROUND AND RATIONALE

2.1 Positionality

As the SEFI SIG for Capacity Building, we lean on previous research (outlined above) that points to the importance of teaching not only technical knowledge and skills, but to also engaging students in the social, emotional, and professional aspects of being and becoming socially responsible engineers. Changing engineering education in this way requires transforming assumptions, practices, and structures, both individually and collectively. Exchanging experiences, ideas, dreams, and concerns is an important first step for fostering a community of research and practice of capacity builders who, over time, can support momentum for transformative change in engineering education.

2.2 Capacity Building

Capacity building is defined as the process of developing and strengthening the skills, instincts, abilities, processes, and resources that organisations and communities need to survive, adapt, and thrive in a fast-changing world [7]. Within SEFI, this is translated into the aim to empower the process of developing and strengthening the competencies that trainers (faculty, staff, student teachers, and researchers) in engineering higher education need to support and impact their students.

3 WORKSHOP DESIGN

The workshop was organised in three parts to facilitate conversation and engagement between the participants, facilitators, and panellists.

Part 1 of the workshop introduced the participants to the topic of the workshop, outlining the aims; our definitions of capacity building, socially responsible engineers, emotional responsibility, and cultural context; what is already known in literature about the intersection between these concepts and how it plays out in engineering education practice.

Part 2 of the workshop provided participants with the opportunity to self-select into three topical groups: (1) capacity building to educate socially responsible engineers, (2) the emotional load or labour of teaching the social and professional aspects of becoming socially responsible engineers, and (3) the relevance of cultural context in teaching social responsibility. Within each group, participants engaged in brief, rotating one-on-one conversations. In these conversations, participants were encouraged to share their thoughts and emotions related to their chosen topic and to share and/or co-develop reflection questions that could guide further exploration of the topic, both individually and collectively. Focusing on reflection questions allowed us to take into account that specific tools or methods for capacity building are context dependent. Thus, our aim was not to simply share best practices that may or may not be relevant to different cultural and disciplinary backgrounds but rather generate reflective dialogue that participants could use to develop good practices for their own specific context.

Part 3 of the workshop consisted of a panel discussion in which participants posed the reflective questions they developed during Part 2 to panellists who have expertise in each of the three topic areas. The aim of this part was to consolidate understanding, bring different perspectives to the forefront, and learn from experts, enabling participants to leave with new knowledge, contacts, and plans for the future.

4 WORKSHOP RESULTS

Participants recorded questions and reflections on Padlet to guide the panel discussion and provide a community resource. Three primary themes emerged in the panel discussion. (1) Defining social responsibility in a globalised context and reconciling different world views: One takeaway was that social responsibility takes on different meanings in various contexts, and our goal as educators should not be convergence. We can celebrate differing world views and learn from them through inter- and transdisciplinarity. (2) Choosing 'safe' topics for the classroom: The group reflected that cultural and political factors can make it challenging for educators to know which topics are safe to bring into classroom conversation. Creating group norms around respect and openness can support the classroom environment, but some level of discomfort can be expected and should be acknowledged. It is important for educators to consider how much discomfort is reasonable and whose discomfort is generally tolerated in engineering education – both of which are affected by privilege. (3) Supporting staff: A final theme centred on support staff need for educating socially responsible engineers. Considerations include how comfortable staff are in pushing the boundaries of students' learning and making a conscience effort to show such teaching has a purpose on which students should reflect.

5 SIGNIFICANCE

The contemporary practice of engineering involves the consideration and negotiation of varied perspectives and interests in achieving sustainable economic, social, and environmental outcomes. Therefore, it is critical that engineering educators have the capacity -- which consists of a combination of knowledge, pedagogical skills, and understanding of global context and emotional aspects of teaching and learning -- to prepare their graduates to practice engineering in a socially responsible manner. This workshop modelled and explained transferrable approaches to engaging teaching staff and students in contextually appropriate capacity building activities.

Conference Key Areas: *Continuing education and life-long learning in engineering; Curriculum development and emerging curriculum models in engineering.*
Keywords: *Continuing education, life-long learning, continuing engineering education, needs, curriculum*

ABSTRACT

Universities face increasing demand for Continuing Engineering Education (CEE). However, prospective students' and industry's expectations and needs differ from those associated with traditional university education offerings. Educators thus face new challenges in planning and implementing the curricula whilst navigating the diverse needs of student groups, including undergraduate and graduate students, as well as lifelong learners who want to update or renew their skills, knowledge, and work-life competencies. The workshop organized by the CEE/LLL SIG gathered views from three different perspectives (learner, educator and successful CEE implementation models). Key findings show that there is a desire for a range of CEE offerings, but it is complex - with varying individual learner motivations and needs, challenging for universities to select and develop viable and valuable offerings, as well as the need to develop the skills of their staff further. Also, new technologies have the opportunity to offer greater personalisation and the potential and risks of these need to be explored further. These themes inform further research as well as development activities in higher education institutions.

1 MOTIVATION, GOALS AND LEARNING OUTCOMES

1.1 Motivation

Universities face increasing demand for Continuing Engineering Education (CEE), particularly in a post-COVID world (Ossiannilsson 2022). For example, according to a UNESCO report on trends in LLL (lifelong learning), 53% of HEIs (Higher Education Institutions) surveyed had a unit dedicated to LLL. However, 55.1% of respondents considered employer/labour market involvement a challenge (UNESCO 2023, 33-34). Moreover, 61.4% of respondents reported scientific research on LLL as challenging. Importantly, the survey did not consider lifelong learners' or educators' needs and expectations.

The expectations and needs from the point of view of the prospective students and industry differ from those associated with traditional university education offerings. Thus, educators face new challenges in planning and implementing the curricula, whilst taking into account the diverse needs of different student groups engaged in CEE, including undergraduate students and life-long learners who desire to renew their skills, knowledge, and work-life competences (Lybecker Korning and Nørgaard 2023). Designing the offering to meet students' and educators' needs and expectations requires novel models and approaches for developing and implementing the CEE offerings. This workshop aimed to identify the needs and challenges, as well as successful and innovative approaches and models to develop and deliver CEE offerings.

1.2 Goals and learning outcomes

The workshop aimed to bring together lifelong learners, labour union and industry representatives, educators, university managers, and other CEE staff and interested parties to share needs and requirements for developing CEE both from the point of view of students and educators. At the same time, novel and innovative approaches and experiences for organizing and delivering CEE to meet the stakeholder needs of both groups were aimed to be shared.

The expected learning outcomes included:

- understanding the needs and expectations of life-long learners in terms of how CEE is organized, offered, and delivered, as well as how these needs are identified and used for CEE development
- understanding of the needs of educators in implementing and delivering CEE, challenges to be solved from the perspective of educators
- sharing of approaches and models that have been found successful by educators in practical CEE implementation work

2 WORKSHOP DESIGN

2.1 Questions addressed in the workshop

Based on the goals and expected learning outcomes, the questions addressed in the workshop were the following:

1. How can we better understand the needs and expectations of lifelong learners regarding the organization, delivery, and offerings of Continuing Engineering Education (CEE)? What gaps exist in our knowledge regarding these needs and expectations, and how can they be addressed to inform the development of CEE programs?
2. What are the challenges educators face in implementing and delivering CEE, and how do these challenges impact the effectiveness of CEE programs? How can we address these challenges to support educators better in their CEE delivery?
3. What approaches and models have educators found successful in their practical implementation of CEE programs? How can these successful strategies be adapted and scaled to enhance the delivery and impact of CEE initiatives?

2.2 Organization of the workshop

The 60-minute workshop consisted of group work on the three main questions to be answered. The method used was World Café (Löhr, Weinhardt & Sieber 2020), which engages the participants in active dialogue, interaction, and knowledge sharing. Three groups gathered to share and collect answers to the questions. A0-sized papers, pens, and Post-it notes were used to collect the answers. Three rounds of group work took place, each group changing tables for the theme to work on every 10 minutes. Four workshop organizers acted as table hosts, introducing a summary of the results from the previous round to the next group when tables were changed. At the end of the workshop, the results were discussed together, and table hosts presented a summary of the discussions for everyone. The results were collected for analysis and reporting to this revised workshop paper.

Workshop schedule was the following:

10 minutes – Welcome and introduction to method and questions to be answered.

30 minutes – working in small groups, 3 rounds of 10 minutes working

20 minutes – sharing the insights from the three themes and collecting generated materials for further analysis.

There were 12 participants in the workshop working in three groups, in addition to four facilitating hosts.

3 RESULTS

3.1 Understanding learner needs and expectations

The most discussed theme related to student needs and expectations was, whether we at university know, and do learners themselves really know, what they need. Some participants mentioned that the learners' needs and expectations may be high or learners do not recognize the needs themselves. The offering directed to the explicitly stated learner needs may not match the true needs after all, or the expressed needs and wishes may be too broad. In addition, there is a challenge to recognize the right target groups by the universities and educators, and therefore their needs are not known. Also, demographics (such as age) and other background related issues may create differences in the needs.

The second discussed theme addressed the value of the CEE for the learners, who are in work-life-study situation. Two main aspects arose in the discussion. First, the participants raised a question that the learners consider “is it worth my while” to study. The second thing to consider by learners is, how does learning fit with work life and personal life. This also led to discussing the financial and time related aspects of studying. Two aspects were mentioned - who pays for the studies, and whether we are addressing university or paid education. In addition, one of the workshop participants mentioned that he/she proposed to employers that they would provide work time for studies. Therefore, it is important that the offering is perceived valuable from both time and money perspective and the offering needs to create value for the students. This value and its dimensions for different learner groups needs to be understood when designing the CEE/LLL offering.

Some of the discussions also revolved around learners’ motivation to participate. It was discussed whether learners are motivated and whether they are intrinsically motivated or are forced to study. One of the participants mentioned that learners may have low confidence in their own capability to learn, even though they have years of work experience behind them. This also led to discussing how important it is to value the learners as resources themselves in CEE, as they have experience and practice related knowledge based on their work-life-study experience. This can be facilitated through peer learning, however, the value of the practice related knowledge might not be realized by the learners themselves.

To be able to better understand the needs of learners, directly asking them was suggested as the most obvious solution. It was mentioned that this should be complemented by also quantitatively monitoring aspects of their online presence. This would call for using also learning analytics as part of the quantitative monitoring. Qualitative methods could then be used to search for explanations for the behaviour from the learners directly.

3.2 Challenges for educators

The educators discussed some of the topics raised above, specifically around time commitment from the learner (so work-life balance), diverse needs (motivations) including up- and re-skilling, and financial aspects such as who pays (including whether employers should sponsor).

Another aspect of the financial picture is that for the providers (universities) and how to identify CEE offerings that will have sufficient volume to make them financially viable. It was noted that it takes specific resources and skill-sets to develop a CEE offering. This requirement, combined with the often-conservative approach of universities, can make it challenging to make the business case. Oftentimes, this will be a new endeavour for individuals and institutions and there is a lack of guidelines at university level on how to develop effective CEE courses. Additionally, the university needs to invest in its educators so that they can deliver effective CEE courses.

Also, equity, diversity and inclusion were highlighted, particularly when those looking for CEE courses will have particular motivations, so for educators they need to provide opportunity for contextualisation and personalisation. Different ideas were discussed, including self-paced learning, a mixture of delivery modes (online, synchronous and asynchronous, hybrid), use of problem- and challenge-based learning, as well as the potential use of AI; the use of AI is a clear area for future investigation.

3.3 Successful models and strategies for CEE implementation

Firstly, it was recognised that there is not a single model and that there are a range of models. These models covered different dimensions:

1. Formal versus non-formal/in-formal learning: the participants shared that there are a range of ways for practising engineers to learn, including formal courses, informal learning, Communities of Practice, and that recognising this diversity is important.
2. Diverse offering (size of formal learning): some participants argued that a Higher Education Institution needs to have a diversity of offering, namely short (e.g., weekend courses), micro-credentials, semester-long courses and full Masters programmes;
3. Diversity of topics: some participant's institutions only offered CEE courses in areas in which they had expertise, whereas others had a mixture of technical courses and courses around management and leadership;
4. Different Learning Management Systems (LMS): based on the diverse offerings then a mixture of both the university's own LMS or a platform (such as EdX or FutureLearn). The use of platforms for MOOCs was seen as beneficial as these platforms support marketing and other back-office functions.
5. With credits and without credits: credits were understood in two main ways - a) ECTS credits; and b) recognition. The second (recognition) was more supported by participants, including the ability to share achievements digitally. For ECTS credits then this was recognised as not always being of relevance and importance to learners, teachers or to companies.

In terms of strategies, then understanding the needs and demand for CEE offerings was identified as critical. For some CEE offerings, this will mean that industry involvement is essential, and that co-creation of the offering (outcomes and syllabus) works best. To achieve this collaboration and recognise that defining requirements is often iterative, then effective approaches to manage change and gain consensus are required; often this is through key people that can bridge any different usage in language between different groups and can manage this change effectively.

Examples were shared where government funding has been a key enabler of successful CEE offerings as this had enabled universities and employers to work together around an agreed focal area.

Success was seen by participants in different ways - for students about broadening learning, supporting career development, enhancement of social and professional networks, and for the university about building reputation (e.g., in an area of expertise), connecting to the community, as well as financial.

Finally, the participants recognised that currently universities were not engaging sufficiently with alumni - as co-creators a) to identify need and demand, and b) to design and deliver CEE offerings - and this was a strategy that was identified to enhance future CEE offerings.

4 FUTURE RESEARCH AND DEVELOPMENT NEEDS

In conclusion, the workshop explored the needs and motivations for CEE from three different perspectives. The discussions highlighted a number of shared topics that are worthy of future investigations: 1) how to determine needs of learners and opportunities of sufficient scale to make CEE offerings viable and valuable for learners; 2) need for greater guidance for universities on how to approach developing CEE offerings, which is linked to 3) the need to provide educator training and support to be able to deliver CEE offerings effectively including contextualisation and personalisation of learning. It was discussed that 4) AI and other technologies have potential benefit to educators and students alike to personalise, which 5) can help better align to learners' motivations and it is important for those offering CEE courses to understand these appropriately.
